

Welcome to **E-XFL.COM**

Embedded - System On Chip (SoC): The Heart of Modern Embedded Systems

Embedded - System On Chip (SoC) refers to an integrated circuit that consolidates all the essential components of a computer system into a single chip. This includes a microprocessor, memory, and other peripherals, all packed into one compact and efficient package. SoCs are designed to provide a complete computing solution, optimizing both space and power consumption, making them ideal for a wide range of embedded applications.

What are **Embedded - System On Chip (SoC)**?

System On Chip (SoC) integrates multiple functions of a computer or electronic system onto a single chip. Unlike traditional multi-chip solutions. SoCs combine a central

Details	
Product Status	Active
Architecture	MCU, FPGA
Core Processor	Dual ARM® Cortex®-A9 MPCore™ with CoreSight™
Flash Size	-
RAM Size	256KB
Peripherals	DMA, POR, WDT
Connectivity	EBI/EMI, Ethernet, I ² C, MMC/SD/SDIO, SPI, UART/USART, USB OTG
Speed	1.5GHz
Primary Attributes	FPGA - 570K Logic Elements
Operating Temperature	0°C ~ 100°C (TJ)
Package / Case	1152-BBGA, FCBGA
Supplier Device Package	1152-FBGA, FC (35x35)
Purchase URL	https://www.e-xfl.com/product-detail/intel/10as057k2f35e1hg

Email: info@E-XFL.COM

Address: Room A, 16/F, Full Win Commercial Centre, 573 Nathan Road, Mongkok, Hong Kong

Key Advantages of Intel Arria 10 Devices

Table 2. Key Advantages of the Intel Arria 10 Device Family

Advantage	Supporting Feature
Enhanced core architecture	Built on TSMC's 20 nm process technology 60% higher performance than the previous generation of mid-range FPGAs 15% higher performance than the fastest previous-generation FPGA
High-bandwidth integrated transceivers	 Short-reach rates up to 25.8 Gigabits per second (Gbps) Backplane capability up to 12.5 Gbps Integrated 10GBASE-KR and 40GBASE-KR4 Forward Error Correction (FEC)
Improved logic integration and hard IP blocks	8-input adaptive logic module (ALM) Up to 65.6 megabits (Mb) of embedded memory Variable-precision digital signal processing (DSP) blocks Fractional synthesis phase-locked loops (PLLs) Hard PCI Express Gen3 IP blocks Hard memory controllers and PHY up to 2,400 Megabits per second (Mbps)
Second generation hard processor system (HPS) with integrated ARM* Cortex*-A9* MPCore* processor	Tight integration of a dual-core ARM Cortex-A9 MPCore processor, hard IP, and an FPGA in a single Intel Arria 10 system-on-a-chip (SoC) Supports over 128 Gbps peak bandwidth with integrated data coherency between the processor and the FPGA fabric
Advanced power savings	Comprehensive set of advanced power saving features Power-optimized MultiTrack routing and core architecture Up to 40% lower power compared to previous generation of mid-range FPGAs Up to 60% lower power compared to previous generation of high-end FPGAs

Summary of Intel Arria 10 Features

Table 3. Summary of Features for Intel Arria 10 Devices

Feature	Description
Technology	 TSMC's 20-nm SoC process technology Allows operation at a lower V_{CC} level of 0.82 V instead of the 0.9 V standard V_{CC} core voltage
Packaging	 1.0 mm ball-pitch Fineline BGA packaging 0.8 mm ball-pitch Ultra Fineline BGA packaging Multiple devices with identical package footprints for seamless migration between different FPGA densities Devices with compatible package footprints allow migration to next generation high-end Stratix® 10 devices RoHS, leaded⁽¹⁾, and lead-free (Pb-free) options
High-performance FPGA fabric	 Enhanced 8-input ALM with four registers Improved multi-track routing architecture to reduce congestion and improve compilation time Hierarchical core clocking architecture Fine-grained partial reconfiguration
Internal memory blocks	M20K—20-Kb memory blocks with hard error correction code (ECC) Memory logic array block (MLAB)—640-bit memory

A10-OVERVIEW | 2018.04.09

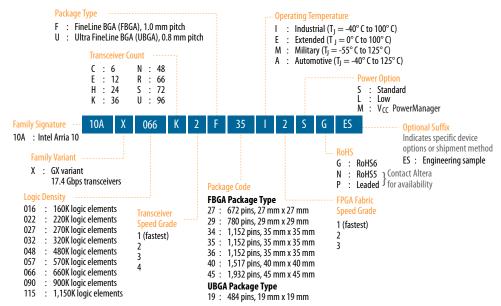

Feature		Description				
Embedded Hard IP blocks	Variable-precision DSP	 Native support for signal processing precision levels from 18 x 19 to 54 x 54 Native support for 27 x 27 multiplier mode 64-bit accumulator and cascade for systolic finite impulse responses (FIRs) Internal coefficient memory banks Preadder/subtractor for improved efficiency Additional pipeline register to increase performance and reduce power Supports floating point arithmetic: Perform multiplication, addition, subtraction, multiply-add, multiply-subtract, and complex multiplication. Supports multiplication with accumulation capability, cascade summation, and cascade subtraction capability. Dynamic accumulator reset control. Support direct vector dot and complex multiplication chaining multiply floating point DSP blocks. 				
	Memory controller	DDR4, DDR3, and DDR3L				
	PCI Express*	PCI Express (PCIe*) Gen3 (x1, x2, x4, or x8), Gen2 (x1, x2, x4, or x8) and Gen1 (x1, x2, x4, or x8) hard IP with complete protocol stack, endpoint, and root port				
	Transceiver I/O	10GBASE-KR/40GBASE-KR4 Forward Error Correction (FEC) PCS hard IPs that support:				
Core clock networks	 667 MHz externa 800 MHz LVDS in Global, regional, and 	c clocking, depending on the application: I memory interface clocking with 2,400 Mbps DDR4 interface terface clocking with 1,600 Mbps LVDS interface I peripheral clock networks are not used can be gated to reduce dynamic power				
Phase-locked loops (PLLs)	 Support integer r Fractional mode s Integer PLLs: Adjacent to gene 	rnthesis, clock delay compensation, and zero delay buffering (ZDB) mode and fractional mode support with third-order delta-sigma modulation				
FPGA General-purpose I/Os (GPIOs)	 1.6 Gbps LVDS—every pair can be configured as receiver or transmitter On-chip termination (OCT) 1.2 V to 3.0 V single-ended LVTTL/LVCMOS interfacing 					
External Memory Interface	DDR4—speeds upDDR3—speeds up	oller— DDR4, DDR3, and DDR3L support to 1,200 MHz/2,400 Mbps to 1,067 MHz/2,133 Mbps to 1,067 MHz/2,133 Mbps to 1,067 MHz/2,134 Mhz/2,134 Mbps to 1,067 Mhz/2,134

Figure 5. ALM for Intel Arria 10 Devices

The Intel Quartus Prime software optimizes your design according to the ALM logic structure and automatically maps legacy designs into the Intel Arria 10 ALM architecture.

Variable-Precision DSP Block

The Intel Arria 10 variable precision DSP blocks support fixed-point arithmetic and floating-point arithmetic.

Features for fixed-point arithmetic:

- · High-performance, power-optimized, and fully registered multiplication operations
- 18-bit and 27-bit word lengths
- Two 18 x 19 multipliers or one 27 x 27 multiplier per DSP block
- Built-in addition, subtraction, and 64-bit double accumulation register to combine multiplication results
- Cascading 19-bit or 27-bit when pre-adder is disabled and cascading 18-bit when pre-adder is used to form the tap-delay line for filtering applications
- Cascading 64-bit output bus to propagate output results from one block to the next block without external logic support
- Hard pre-adder supported in 19-bit and 27-bit modes for symmetric filters
- Internal coefficient register bank in both 18-bit and 27-bit modes for filter implementation
- 18-bit and 27-bit systolic finite impulse response (FIR) filters with distributed output adder
- Biased rounding support

A10-OVERVIEW | 2018.04.09

Features for floating-point arithmetic:

- A completely hardened architecture that supports multiplication, addition, subtraction, multiply-add, and multiply-subtract
- Multiplication with accumulation capability and a dynamic accumulator reset control
- Multiplication with cascade summation capability
- Multiplication with cascade subtraction capability
- Complex multiplication
- Direct vector dot product
- Systolic FIR filter

Table 15. Variable-Precision DSP Block Configurations for Intel Arria 10 Devices

Usage Example	Multiplier Size (Bit)	DSP Block Resources
Medium precision fixed point	Two 18 x 19	1
High precision fixed or Single precision floating point	One 27 x 27	1
Fixed point FFTs	One 19 x 36 with external adder	1
Very high precision fixed point	One 36 x 36 with external adder	2
Double precision floating point	One 54 x 54 with external adder	4

Embedded Memory Blocks

The embedded memory blocks in the devices are flexible and designed to provide an optimal amount of small- and large-sized memory arrays to fit your design requirements.

Embedded Memory Configurations for Single-port Mode

Table 19. Single-port Embedded Memory Configurations for Intel Arria 10 Devices

This table lists the maximum configurations supported for single-port RAM and ROM modes.

Memory Block	Depth (bits)	Programmable Width
MLAB	32	x16, x18, or x20
	64 (10)	x8, x9, x10
M20K	512	x40, x32
	1K	x20, x16
	2K	x10, x8
	4K	x5, x4
	8K	x2
	16K	x1

Clock Networks and PLL Clock Sources

The clock network architecture is based on Intel's global, regional, and peripheral clock structure. This clock structure is supported by dedicated clock input pins, fractional clock synthesis PLLs, and integer I/O PLLs.

Clock Networks

The Intel Arria 10 core clock networks are capable of up to 800 MHz fabric operation across the full industrial temperature range. For the external memory interface, the clock network supports the hard memory controller with speeds up to 2,400 Mbps in a quarter-rate transfer.

To reduce power consumption, the Intel Quartus Prime software identifies all unused sections of the clock network and powers them down.

Fractional Synthesis and I/O PLLs

Intel Arria 10 devices contain up to 32 fractional synthesis PLLs and up to 16 I/O PLLs that are available for both specific and general purpose uses in the core:

- Fractional synthesis PLLs—located in the column adjacent to the transceiver blocks
- I/O PLLs-located in each bank of the 48 I/Os

Fractional Synthesis PLLs

You can use the fractional synthesis PLLs to:

- Reduce the number of oscillators that are required on your board
- Reduce the number of clock pins that are used in the device by synthesizing multiple clock frequencies from a single reference clock source

⁽¹⁰⁾ Supported through software emulation and consumes additional MLAB blocks.

A10-OVERVIEW | 2018.04.09

The fractional synthesis PLLs support the following features:

- Reference clock frequency synthesis for transceiver CMU and Advanced Transmit (ATX) PLLs
- Clock network delay compensation
- Zero-delay buffering
- Direct transmit clocking for transceivers
- Independently configurable into two modes:
 - Conventional integer mode equivalent to the general purpose PLL
 - Enhanced fractional mode with third order delta-sigma modulation
- PLL cascading

I/O PLLs

The integer mode I/O PLLs are located in each bank of 48 I/Os. You can use the I/O PLLs to simplify the design of external memory and high-speed LVDS interfaces.

In each I/O bank, the I/O PLLs are adjacent to the hard memory controllers and LVDS SERDES. Because these PLLs are tightly coupled with the I/Os that need to use them, it makes it easier to close timing.

You can use the I/O PLLs for general purpose applications in the core such as clock network delay compensation and zero-delay buffering.

Intel Arria 10 devices support PLL-to-PLL cascading.

FPGA General Purpose I/O

Intel Arria 10 devices offer highly configurable GPIOs. Each I/O bank contains 48 general purpose I/Os and a high-efficiency hard memory controller.

The following list describes the features of the GPIOs:

- Consist of 3 V I/Os for high-voltage application and LVDS I/Os for differential signaling
 - $-\$ Up to two 3 V I/O banks, available in some devices, that support up to 3 V I/O standards
 - LVDS I/O banks that support up to 1.8 V I/O standards
- Support a wide range of single-ended and differential I/O interfaces
- LVDS speeds up to 1.6 Gbps
- Each LVDS pair of pins has differential input and output buffers, allowing you to configure the LVDS direction for each pair.
- Programmable bus hold and weak pull-up
- Programmable differential output voltage (V_{OD}) and programmable pre-emphasis

PCIe Gen1, Gen2, and Gen3 Hard IP

Intel Arria 10 devices contain PCIe hard IP that is designed for performance and ease-of-use:

- Includes all layers of the PCIe stack—transaction, data link and physical layers.
- Supports PCIe Gen3, Gen2, and Gen1 Endpoint and Root Port in x1, x2, x4, or x8 lane configuration.
- Operates independently from the core logic—optional configuration via protocol (CvP) allows the PCIe link to power up and complete link training in less than 100 ms while the Intel Arria 10 device completes loading the programming file for the rest of the FPGA.
- Provides added functionality that makes it easier to support emerging features such as Single Root I/O Virtualization (SR-IOV) and optional protocol extensions.
- Provides improved end-to-end datapath protection using ECC.
- Supports FPGA configuration via protocol (CvP) using PCIe at Gen3, Gen2, or Gen1 speed.

Enhanced PCS Hard IP for Interlaken and 10 Gbps Ethernet

Interlaken Support

The Intel Arria 10 enhanced PCS hard IP provides integrated Interlaken PCS supporting rates up to 25.8 Gbps per lane.

The Interlaken PCS is based on the proven functionality of the PCS developed for Intel's previous generation FPGAs, which demonstrated interoperability with Interlaken ASSP vendors and third-party IP suppliers. The Interlaken PCS is present in every transceiver channel in Intel Arria 10 devices.

10 Gbps Ethernet Support

The Intel Arria 10 enhanced PCS hard IP supports 10GBASE-R PCS compliant with IEEE 802.3 10 Gbps Ethernet (10GbE). The integrated hard IP support for 10GbE and the 10 Gbps transceivers save external PHY cost, board space, and system power.

Each transceiver channel contains a channel PLL that can be used as the CMU PLL or clock data recovery (CDR) PLL. In CDR mode, the channel PLL recovers the receiver clock and data in the transceiver channel. Up to 80 independent data rates can be configured on a single Intel Arria 10 device.

Table 23. PMA Features of the Transceivers in Intel Arria 10 Devices

Feature	Capability	
Chip-to-Chip Data Rates	1 Gbps to 17.4 Gbps (Intel Arria 10 GX devices) 1 Gbps to 25.8 Gbps (Intel Arria 10 GT devices)	
Backplane Support	Drive backplanes at data rates up to 12.5 Gbps	
Optical Module Support	SFP+/SFP, XFP, CXP, QSFP/QSFP28, CFP/CFP2/CFP4	
Cable Driving Support	SFP+ Direct Attach, PCI Express over cable, eSATA	
Transmit Pre-Emphasis	4-tap transmit pre-emphasis and de-emphasis to compensate for system channel loss	
Continuous Time Linear Equalizer (CTLE)	Dual mode, high-gain, and high-data rate, linear receive equalization to compensate for system channel loss	
Decision Feedback Equalizer (DFE)	7-fixed and 4-floating tap DFE to equalize backplane channel loss in the presence of crosstalk and noisy environments	
Variable Gain Amplifier	Optimizes the signal amplitude prior to the CDR sampling and operates in fixed and adaptive modes	
Altera Digital Adaptive Parametric Tuning (ADAPT)	Fully digital adaptation engine to automatically adjust all link equalization parameters—including CTLE, DFE, and variable gain amplifier blocks—that provide optimal link margin without intervention from user logic	
Precision Signal Integrity Calibration Engine (PreSICE)	Hardened calibration controller to quickly calibrate all transceiver control parameters on power-up, which provides the optimal signal integrity and jitter performance	
Advanced Transmit (ATX) PLL	Low jitter ATX (LC tank based) PLLs with continuous tuning range to cover a wide range of standard and proprietary protocols	
Fractional PLLs	On-chip fractional frequency synthesizers to replace on-board crystal oscillators and reduce system cost	
Digitally Assisted Analog CDR Superior jitter tolerance with fast lock time		
Dynamic Partial Reconfiguration	Allows independent control of the Avalon memory-mapped interface of each transceiver channel for the highest transceiver flexibility	
Multiple PCS-PMA and PCS-PLD interface widths 8-, 10-, 16-, 20-, 32-, 40-, or 64-bit interface widths for flexibility of deserialization encoding, and reduced latency		

PCS Features

This table summarizes the Intel Arria 10 transceiver PCS features. You can use the transceiver PCS to support a wide range of protocols ranging from 1 Gbps to 25.8 Gbps.

Protocol	Data Rate (Gbps)	Transceiver IP	PCS Support
CPRI 6.0 (64B/66B)	0.6144 to 10.1376	Native PHY	Enhanced PCS
CPRI 4.2 (8B/10B)	0.6144 to 9.8304	Native PHY	Standard PCS
OBSAI RP3 v4.2	0.6144 to 6.144	Native PHY	Standard PCS
SD-SDI/HD-SDI/3G-SDI	0.143 ⁽¹²⁾ to 2.97	Native PHY	Standard PCS

SoC with Hard Processor System

Each SoC device combines an FPGA fabric and a hard processor system (HPS) in a single device. This combination delivers the flexibility of programmable logic with the power and cost savings of hard IP in these ways:

- Reduces board space, system power, and bill of materials cost by eliminating a discrete embedded processor
- Allows you to differentiate the end product in both hardware and software, and to support virtually any interface standard
- Extends the product life and revenue through in-field hardware and software updates

⁽¹²⁾ The 0.143 Gbps data rate is supported using oversampling of user logic that you must implement in the FPGA fabric.

Features of the HPS

The HPS has the following features:

- 1.2-GHz, dual-core ARM Cortex-A9 MPCore processor with up to 1.5-GHz via overdrive
 - ARMv7-A architecture that runs 32-bit ARM instructions, 16-bit and 32-bit
 Thumb instructions, and 8-bit Java byte codes in Jazelle style
 - Superscalar, variable length, out-of-order pipeline with dynamic branch prediction
 - Instruction Efficiency 2.5 MIPS/MHz, which provides total performance of 7500 MIPS at 1.5 GHz
- Each processor core includes:
 - 32 KB of L1 instruction cache, 32 KB of L1 data cache
 - Single- and double-precision floating-point unit and NEON media engine
 - CoreSight debug and trace technology
 - Snoop Control Unit (SCU) and Acceleration Coherency Port (ACP)
- 512 KB of shared L2 cache
- 256 KB of scratch RAM
- Hard memory controller with support for DDR3, DDR4 and optional error correction code (ECC) support
- Multiport Front End (MPFE) Scheduler interface to the hard memory controller
- 8-channel direct memory access (DMA) controller
- QSPI flash controller with SIO, DIO, QIO SPI Flash support
- NAND flash controller (ONFI 1.0 or later) with DMA and ECC support, updated to support 8 and 16-bit Flash devices and new command DMA to offload CPU for fast power down recovery
- Updated SD/SDIO/MMC controller to eMMC 4.5 with DMA with CE-ATA digital command support
- 3 10/100/1000 Ethernet media access control (MAC) with DMA
- 2 USB On-the-Go (OTG) controllers with DMA
- 5 I²C controllers (3 can be used by EMAC for MIO to external PHY)
- 2 UART 16550 Compatible controllers
- 4 serial peripheral interfaces (SPI) (2 Master, 2 Slaves)
- 62 programmable general-purpose I/Os, which includes 48 direct share I/Os that allows the HPS peripherals to connect directly to the FPGA I/Os
- 7 general-purpose timers
- 4 watchdog timers
- Anti-tamper, Secure Boot, Encryption (AES) and Authentication (SHA)

The optional power reduction techniques in Intel Arria 10 devices include:

- SmartVID—a code is programmed into each device during manufacturing that allows a smart regulator to operate the device at lower core V_{CC} while maintaining performance
- **Programmable Power Technology**—non-critical timing paths are identified by the Intel Quartus Prime software and the logic in these paths is biased for low power instead of high performance
- **Low Static Power Options**—devices are available with either standard static power or low static power while maintaining performance

Furthermore, Intel Arria 10 devices feature Intel's industry-leading low power transceivers and include a number of hard IP blocks that not only reduce logic resources but also deliver substantial power savings compared to soft implementations. In general, hard IP blocks consume up to 90% less power than the equivalent soft logic implementations.

Incremental Compilation

The Intel Quartus Prime software incremental compilation feature reduces compilation time and helps preserve performance to ease timing closure. The incremental compilation feature enables the partial reconfiguration flow for Intel Arria 10 devices.

Incremental compilation supports top-down, bottom-up, and team-based design flows. This feature facilitates modular, hierarchical, and team-based design flows where different designers compile their respective design sections in parallel. Furthermore, different designers or IP providers can develop and optimize different blocks of the design independently. These blocks can then be imported into the top level project.

Document Revision History for Intel Arria 10 Device Overview

Document Version	Changes
2018.04.09	Updated the lowest V_{CC} from 0.83 V to 0.82 V in the topic listing a summary of the device features.

Date	Version	Changes
January 2018	2018.01.17	Updated the maximum data rate for HPS (Intel Arria 10 SX devices external memory interface DDR3 controller from 2,166 Mbps to 2,133 Mbps.
		Updated maximum frequency supported for half rate QDRII and QDRII + SRAM to 633 MHz in Memory Standards Supported by the Soft Memory Controller table.
		Updated transceiver backplane capability to 12.5 Gbps.
		Removed transceiver speed grade 5 in Sample Ordering Core and Available Options for Intel Arria 10 GX Devices figure.
	ı	continued

Intel® Arria® 10 Device Overview

A10-OVERVIEW | 2018.04.09

Date	Version	Changes
August 2014	2014.08.18	Updated Memory (Kb) M20K maximum resources for Arria 10 GX 660 devices from 42,660 to 42,620.
		Added GPIO columns consisting of LVDS I/O Bank and 3V I/O Bank in the Package Plan table.
		Added how to use memory interface clock frequency higher than 533 MHz in the I/O vertical migration.
		Added information to clarify that RLDRAM3 support uses hard PHY with soft memory controller.
		Added variable precision DSP blocks support for floating-point arithmetic.
June 2014	2014.06.19	Updated number of dedicated I/Os in the HPS block to 17.
February 2014	2014.02.21	Updated transceiver speed grade options for GT devices in Figure 2.
February 2014	2014.02.06	Updated data rate for Arria 10 GT devices from 28.1 Gbps to 28.3 Gbps.
December 2013	2013.12.10	Updated the HPS memory standards support from LPDDR2 to LPDDR3. Updated HPS block diagram to include dedicated HPS I/O and FPGA Configuration blocks as well as repositioned SD/SDIO/MMC, DMA, SPI and NAND Flash with ECC blocks .
December 2013	2013.12.02	Initial release.
