Welcome to **E-XFL.COM**

Embedded - System On Chip (SoC): The Heart of Modern Embedded Systems

Embedded - System On Chip (SoC) refers to an integrated circuit that consolidates all the essential components of a computer system into a single chip. This includes a microprocessor, memory, and other peripherals, all packed into one compact and efficient package. SoCs are designed to provide a complete computing solution, optimizing both space and power consumption, making them ideal for a wide range of embedded applications.

What are Embedded - System On Chip (SoC)?

System On Chip (SoC) integrates multiple functions of a computer or electronic system onto a single chip. Unlike traditional multi-chip solutions, SoCs combine a central

Details

Product Status	Active
Architecture	MCU, FPGA
Core Processor	Dual ARM® Cortex®-A9 MPCore™ with CoreSight™
Flash Size	-
RAM Size	256KB
Peripherals	DMA, POR, WDT
Connectivity	EBI/EMI, Ethernet, I²C, MMC/SD/SDIO, SPI, UART/USART, USB OTG
Speed	1.5GHz
Primary Attributes	FPGA - 570K Logic Elements
Operating Temperature	0°C ~ 100°C (TJ)
Package / Case	1517-BBGA, FCBGA
Supplier Device Package	1517-FCBGA (40x40)
Purchase URL	https://www.e-xfl.com/product-detail/intel/10as057n4f40e3lg

Contents

Feature		Description

Embedded Hard IP blocks	Variable-precision DSP	• Native support for signal processing precision levels from 18 x 19 to 54 x 54
		• Native support for 27 x 27 multiplier mode
		• 64-bit accumulator and cascade for systolic finite impulse responses (FIRs)
		• Internal coefficient memory banks
		• Preadder/subtractor for improved efficiency
		• Additional pipeline register to increase performance and reduce power
		• Supports floating point arithmetic:
		  — Perform multiplication, addition, subtraction, multiply-add, multiply-subtract, and complex multiplication.
		  — Supports multiplication with accumulation capability, cascade summation, and cascade subtraction capability.
		  — Dynamic accumulator reset control.
		  — Support direct vector dot and complex multiplication chaining multiply floating point DSP blocks.

	Memory controller	DDR4, DDR3, and DDR3L
	PCI Express*	PCI Express (PCIe*) Gen3 (x1, x2, x4, or x8), Gen2 (x1, x2, x4, or x8) and Gen1 (x1, x2, x4, or x8) hard IP with complete protocol stack, endpoint, and root port

	Transceiver I/O	• 10GBASE-KR/40GBASE-KR4 Forward Error Correction (FEC)
		• PCS hard IPs that support:
		  — 10-Gbps Ethernet (10GbE)
		  — PCIe PIPE interface
		  — Interlaken
		  — Gbps Ethernet (GbE)
		  — Common Public Radio Interface (CPRI) with deterministic latency support
		  — Gigabit-capable passive optical network (GPON) with fast lock-time support
		• 13.5G JESD204b
		• 8B/10B, 64B/66B, 64B/67B encoders and decoders
		• Custom mode support for proprietary protocols

Core clock networks		• Up to 800 MHz fabric clocking, depending on the application:
		  — 667 MHz external memory interface clocking with 2,400 Mbps DDR4 interface
		  — 800 MHz LVDS interface clocking with 1,600 Mbps LVDS interface
		• Global, regional, and peripheral clock networks
		• Clock networks that are not used can be gated to reduce dynamic power

Phase-locked loops (PLLs)		• High-resolution fractional synthesis PLLs:
		  — Precision clock synthesis, clock delay compensation, and zero delay buffering (ZDB)
		  — Support integer mode and fractional mode
		  — Fractional mode support with third-order delta-sigma modulation
		• Integer PLLs:
		  — Adjacent to general purpose I/Os
		  — Support external memory and LVDS interfaces

FPGA General-purpose I/Os (GPIOs)		• 1.6 Gbps LVDS—every pair can be configured as receiver or transmitter • On-chip termination (OCT) • 1.2 V to 3.0 V single-ended LVTTL/LVCMOS interfacing

External Memory Interface		• Hard memory controller— DDR4, DDR3, and DDR3L support
		  — DDR4—speeds up to 1,200 MHz/2,400 Mbps
		  — DDR3—speeds up to 1,067 MHz/2,133 Mbps
		• Soft memory controller—provides support for RLDRAM 3[2], QDR IV[2], and QDR II+

The Intel Quartus Prime software optimizes your design according to the ALM logic structure and automatically maps legacy designs into the Intel Arria 10 ALM architecture.

Variable-Precision DSP Block

The Intel Arria 10 variable precision DSP blocks support fixed-point arithmetic and floating-point arithmetic.

Features for fixed-point arithmetic:

- High-performance, power-optimized, and fully registered multiplication operations
- 18-bit and 27-bit word lengths
- Two 18 x 19 multipliers or one 27 x 27 multiplier per DSP block
- Built-in addition, subtraction, and 64-bit double accumulation register to combine multiplication results
- Cascading 19-bit or 27-bit when pre-adder is disabled and cascading 18-bit when pre-adder is used to form the tap-delay line for filtering applications
- Cascading 64-bit output bus to propagate output results from one block to the next block without external logic support
- Hard pre-adder supported in 19-bit and 27-bit modes for symmetric filters
- Internal coefficient register bank in both 18-bit and 27-bit modes for filter implementation
- 18-bit and 27-bit systolic finite impulse response (FIR) filters with distributed output adder
- Biased rounding support

Variant	Product Line	Variable-precision DSP Block	Independent Input and Output Multiplications Operator		18 x 19 Multiplier Adder Sum Mode	18 x 18 Multiplier Adder Summed with 36 bit Input

Embedded Memory Blocks

The embedded memory blocks in the devices are flexible and designed to provide an optimal amount of small- and large-sized memory arrays to fit your design requirements.

Types of Embedded Memory

The Intel Arria 10 devices contain two types of memory blocks:

- 20 Kb M20K blocks—blocks of dedicated memory resources. The M20K blocks are ideal for larger memory arrays while still providing a large number of independent ports.

- 640 bit memory logic array blocks (MLABs)—enhanced memory blocks that are configured from dual-purpose logic array blocks (LABs). The MLABs are ideal for wide and shallow memory arrays. The MLABs are optimized for implementation of shift registers for digital signal processing (DSP) applications, wide and shallow FIFO buffers, and filter delay lines. Each MLAB is made up of ten adaptive logic modules (ALMs). In the Intel Arria 10 devices, you can configure these ALMs as ten 32 x 2 blocks, giving you one 32 x 20 simple dual-port SRAM block per MLAB.

Embedded Memory Capacity in Intel Arria 10 Devices

Table 18. **Embedded Memory Capacity and Distribution in Intel Arria 10 Devices**

Variant	Product Line	M20K		MLAB		Total RAM Bit (Kb)
		Block	RAM Bit (Kb)	Block	RAM Bit (Kb)	
Intel Arria 10 GX	GX 160	440	8,800	1,680	1,050	9,850
	GX 220	587	11,740	2,703	1,690	13,430
	GX 270	750	15,000	3,922	2,452	17,452

	GX 1150	2,713	54,260	20,774	12,984	67,244
Intel Arria 10 GT	GT 900	2,423	48,460	15,017	9,386	57,846
	GT 1150	2,713	54,260	20,774	12,984	67,244
Intel Arria 10 SX	SX 160	440	8,800	1,680	1,050	9,850
	SX 220	587	11,740	2,703	1,690	13,430
	SX 270	750	15,000	3,922	2,452	17,452
	SX 320	891	17,820	4,363	2,727	20,547
	SX 480	1,431	28,620	6,662	4,164	32,784
	SX 570	1,800	36,000	8,153	5,096	41,096
	SX 660	2,131	42,620	9,260	5,788	48,408

The fractional synthesis PLLs support the following features:

- Reference clock frequency synthesis for transceiver CMU and Advanced Transmit (ATX) PLLs

- Clock network delay compensation

- Zero-delay buffering

- Direct transmit clocking for transceivers

- Independently configurable into two modes:

  — Conventional integer mode equivalent to the general purpose PLL

  — Enhanced fractional mode with third order delta-sigma modulation

- PLL cascading

I/O PLLs

The integer mode I/O PLLs are located in each bank of 48 I/Os. You can use the I/O PLLs to simplify the design of external memory and high-speed LVDS interfaces.

In each I/O bank, the I/O PLLs are adjacent to the hard memory controllers and LVDS SERDES. Because these PLLs are tightly coupled with the I/Os that need to use them, it makes it easier to close timing.

You can use the I/O PLLs for general purpose applications in the core such as clock network delay compensation and zero-delay buffering.

Intel Arria 10 devices support PLL-to-PLL cascading.

FPGA General Purpose I/O

Intel Arria 10 devices offer highly configurable GPIOs. Each I/O bank contains 48 general purpose I/Os and a high-efficiency hard memory controller.

The following list describes the features of the GPIOs:

- Consist of 3 V I/Os for high-voltage application and LVDS I/Os for differential signaling

  — Up to two 3 V I/O banks, available in some devices, that support up to 3 V I/O standards

  — LVDS I/O banks that support up to 1.8 V I/O standards

- Support a wide range of single-ended and differential I/O interfaces

- LVDS speeds up to 1.6 Gbps

- Each LVDS pair of pins has differential input and output buffers, allowing you to configure the LVDS direction for each pair.

- Programmable bus hold and weak pull-up

- Programmable differential output voltage (V_{OD}) and programmable pre-emphasis

Table 20.   Memory Standards Supported by the Hard Memory Controller

This table lists the overall capability of the hard memory controller. For specific details, refer to the External Memory Interface Spec Estimator and Intel Arria 10 Device Datasheet.

Memory Standard	Rate Support	Ping Pong PHY Support	Maximum Frequency (MHz)
DDR4 SDRAM	Quarter rate	Yes	1,067
		—	1,200
DDR3 SDRAM	Half rate	Yes	533
		—	667
	Quarter rate	Yes	1,067
		—	1,067
DDR3L SDRAM	Half rate	Yes	533
		—	667
	Quarter rate	Yes	933
		—	933
LPDDR3 SDRAM	Half rate	—	533
	Quarter rate	—	800

Table 21.   Memory Standards Supported by the Soft Memory Controller

Memory Standard	Rate Support	Maximum Frequency (MHz)
RLDRAM 3 [11]	Quarter rate	1,200
QDR IV SRAM[11]	Quarter rate	1,067
QDR II SRAM	Full rate	333
	Half rate	633
QDR II+ SRAM	Full rate	333
	Half rate	633
QDR II+ Xtreme SRAM	Full rate	333
	Half rate	633

Table 22.   Memory Standards Supported by the HPS Hard Memory Controller

The hard processor system (HPS) is available in Intel Arria 10 SoC devices only.

Memory Standard	Rate Support	Maximum Frequency (MHz)
DDR4 SDRAM	Half rate	1,200
DDR3 SDRAM	Half rate	1,067
DDR3L SDRAM	Half rate	933

---

[11] Intel Arria 10 devices support this external memory interface using hard PHY with soft memory controller.

Related Information

Lists the memory interface performance according to memory interface standards, rank or chip select configurations, and Intel Arria 10 device speed grades.

PCIe Gen1, Gen2, and Gen3 Hard IP

Intel Arria 10 devices contain PCIe hard IP that is designed for performance and ease-of-use:

- Includes all layers of the PCIe stack—transaction, data link and physical layers.

- Supports PCIe Gen3, Gen2, and Gen1 Endpoint and Root Port in x1, x2, x4, or x8 lane configuration.

- Operates independently from the core logic—optional configuration via protocol (CvP) allows the PCIe link to power up and complete link training in less than 100 ms while the Intel Arria 10 device completes loading the programming file for the rest of the FPGA.

- Provides added functionality that makes it easier to support emerging features such as Single Root I/O Virtualization (SR-IOV) and optional protocol extensions.

- Provides improved end-to-end datapath protection using ECC.

- Supports FPGA configuration via protocol (CvP) using PCIe at Gen3, Gen2, or Gen1 speed.

Related Information

Enhanced PCS Hard IP for Interlaken and 10 Gbps Ethernet

Interlaken Support

The Intel Arria 10 enhanced PCS hard IP provides integrated Interlaken PCS supporting rates up to 25.8 Gbps per lane.

The Interlaken PCS is based on the proven functionality of the PCS developed for Intel's previous generation FPGAs, which demonstrated interoperability with Interlaken ASSP vendors and third-party IP suppliers. The Interlaken PCS is present in every transceiver channel in Intel Arria 10 devices.

Related Information

10 Gbps Ethernet Support

The Intel Arria 10 enhanced PCS hard IP supports 10GBASE-R PCS compliant with IEEE 802.3 10 Gbps Ethernet (10GbE). The integrated hard IP support for 10GbE and the 10 Gbps transceivers save external PHY cost, board space, and system power.

The scalable hard IP supports multiple independent 10GbE ports while using a single PLL for all the 10GBASE-R PCS instantiations, which saves on core logic resources and clock networks:

- Simplifies multiport 10GbE systems compared to XAUI interfaces that require an external XAUI-to-10G PHY.

- Incorporates Electronic Dispersion Compensation (EDC), which enables direct connection to standard 10 Gbps XFP and SFP+ pluggable optical modules.

- Supports backplane Ethernet applications and includes a hard 10GBASE-KR Forward Error Correction (FEC) circuit that you can use for 10 Gbps and 40 Gbps applications.

The 10 Gbps Ethernet PCS hard IP and 10GBASE-KR FEC are present in every transceiver channel.

Low Power Serial Transceivers

Intel Arria 10 FPGAs and SoCs include lowest power transceivers that deliver high bandwidth, throughput and low latency.

Intel Arria 10 devices deliver the industry's lowest power consumption per transceiver channel:

- 12.5 Gbps transceivers at as low as 242 mW

- 10 Gbps transceivers at as low as 168 mW

- 6 Gbps transceivers at as low as 117 mW

Intel Arria 10 transceivers support various data rates according to application:

- Chip-to-chip and chip-to-module applications—from 1 Gbps up to 25.8 Gbps

- Long reach and backplane applications—from 1 Gbps up to 12.5 with advanced adaptive equalization

- Critical power sensitive applications—from 1 Gbps up to 11.3 Gbps using lower power modes

The combination of 20 nm process technology and architectural advances provide the following benefits:

- Significant reduction in die area and power consumption

- Increase of up to two times in transceiver I/O density compared to previous generation devices while maintaining optimal signal integrity

- Up to 72 total transceiver channels—you can configure up to 6 of these channels to run as fast as 25.8 Gbps

- All channels feature continuous data rate support up to the maximum rated speed

Figure 6.   Intel Arria 10 Transceiver Block Architecture
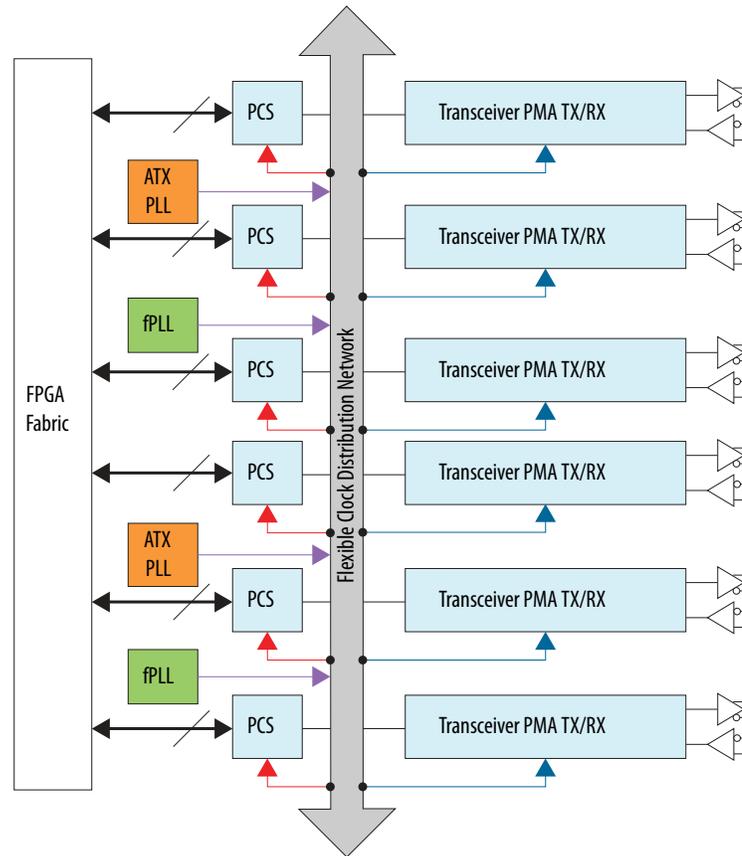

Transceiver Channels

All transceiver channels feature a dedicated Physical Medium Attachment (PMA) and a hardened Physical Coding Sublayer (PCS).

- The PMA provides primary interfacing capabilities to physical channels.
- The PCS typically handles encoding/decoding, word alignment, and other pre-processing functions before transferring data to the FPGA core fabric.

A transceiver channel consists of a PMA and a PCS block. Most transceiver banks have 6 channels. There are some transceiver banks that contain only 3 channels.

A wide variety of bonded and non-bonded data rate configurations is possible using a highly configurable clock distribution network. Up to 80 independent transceiver data rates can be configured.

The following figures are graphical representations of top views of the silicon die, which correspond to reverse views for flip chip packages. Different Intel Arria 10 devices may have different floorplans than the ones shown in the figures.

| PCS	Description
Standard PCS	• Operates at a data rate up to 12 Gbps • Supports protocols such as PCI-Express, CPRI 4.2+, GigE, IEEE 1588 in Hard PCS • Implements other protocols using Basic/Custom (Standard PCS) transceiver configuration rules.
Enhanced PCS	• Performs functions common to most serial data industry standards, such as word alignment, encoding/decoding, and framing, before data is sent or received off-chip through the PMA • Handles data transfer to and from the FPGA fabric • Handles data transfer internally to and from the PMA • Provides frequency compensation • Performs channel bonding for multi-channel low skew applications
PCIe Gen3 PCS	• Supports the seamless switching of Data and Clock between the Gen1, Gen2, and Gen3 data rates • Provides support for PIPE 3.0 features • Supports the PIPE interface with the Hard IP enabled, as well as with the Hard IP bypassed

PCS Protocol Support

This table lists some of the protocols supported by the Intel Arria 10 transceiver PCS. For more information about the blocks in the transmitter and receiver data paths, refer to the related information.

Protocol	Data Rate (Gbps)	Transceiver IP	PCS Support
PCIe Gen3 x1, x2, x4, x8	8.0	Native PHY (PIPE)	Standard PCS and PCIe Gen3 PCS
PCIe Gen2 x1, x2, x4, x8	5.0	Native PHY (PIPE)	Standard PCS
PCIe Gen1 x1, x2, x4, x8	2.5	Native PHY (PIPE)	Standard PCS
1000BASE-X Gigabit Ethernet	1.25	Native PHY	Standard PCS
1000BASE-X Gigabit Ethernet with IEEE 1588v2	1.25	Native PHY	Standard PCS
10GBASE-R	10.3125	Native PHY	Enhanced PCS
10GBASE-R with IEEE 1588v2	10.3125	Native PHY	Enhanced PCS
10GBASE-R with KR FEC	10.3125	Native PHY	Enhanced PCS
10GBASE-KR and 1000BASE-X	10.3125	1G/10GbE and 10GBASE-KR PHY	Standard PCS and Enhanced PCS
Interlaken (CEI-6G/11G)	3.125 to 17.4	Native PHY	Enhanced PCS
SFI-S/SFI-5.2	11.2	Native PHY	Enhanced PCS
10G SDI	10.692	Native PHY	Enhanced PCS

Figure 9. **HPS Block Diagram**

This figure shows a block diagram of the HPS with the dual ARM Cortex-A9 MPCore processor.
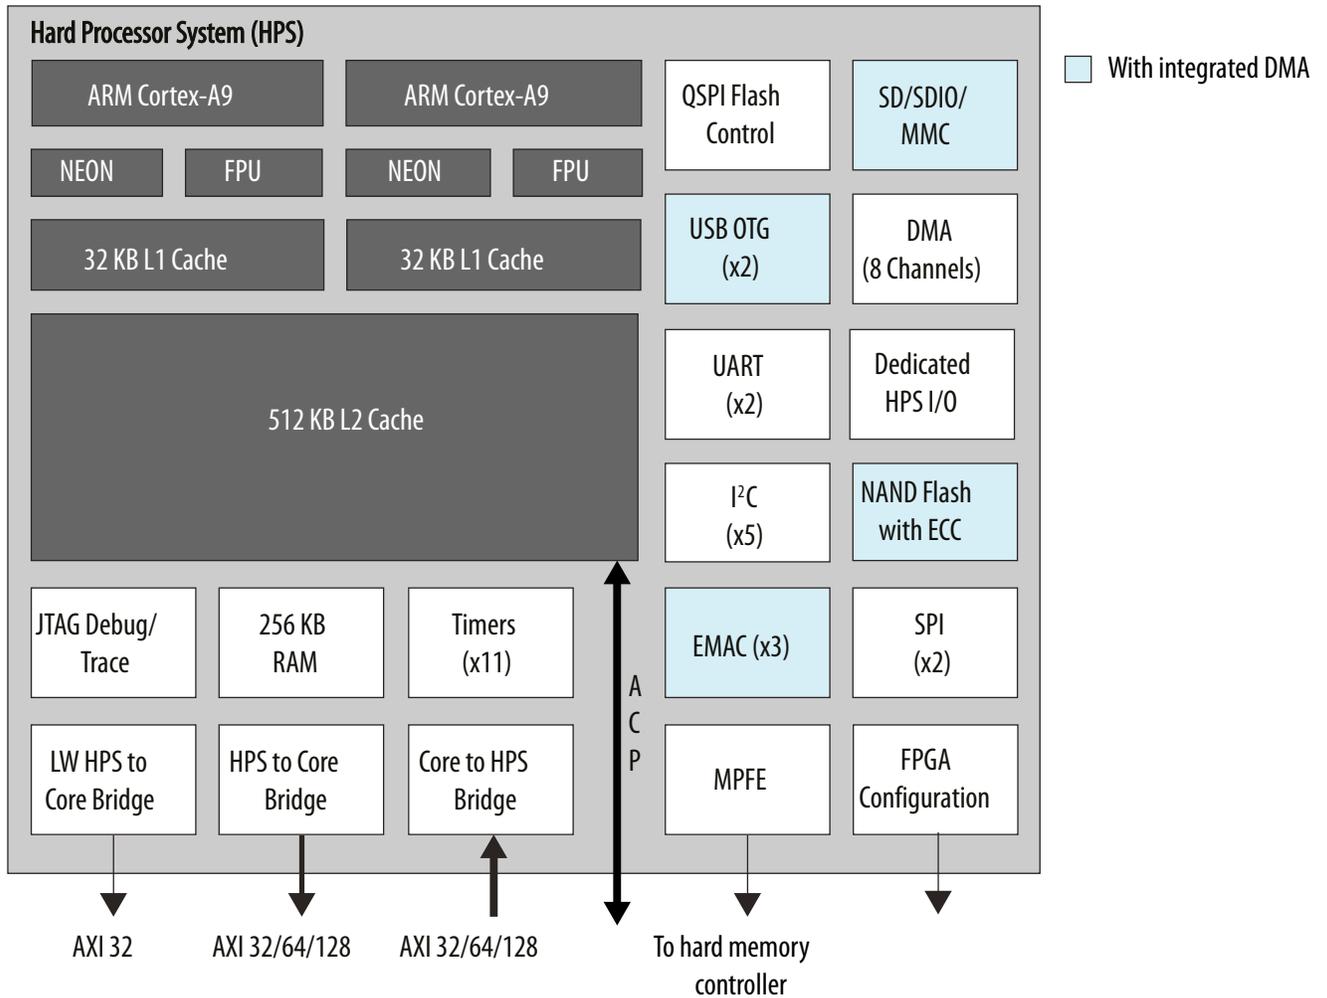

Key Advantages of 20-nm HPS

The 20-nm HPS strikes a balance between enabling maximum software compatibility with 28-nm SoCs while still improving upon the 28-nm HPS architecture. These improvements address the requirements of the next generation target markets such as wireless and wireline communications, compute and storage equipment, broadcast and military in terms of performance, memory bandwidth, connectivity via backplane and security.

Table 24.   Improvements in 20 nm HPS

This table lists the key improvements of the 20 nm HPS compared to the 28 nm HPS.

Advantages/ Improvements	Description
Increased performance and overdrive capability	While the nominal processor frequency is 1.2 GHz, the 20 nm HPS offers an "overdrive" feature which enables a higher processor operating frequency. This requires a higher supply voltage value that is unique to the HPS and may require a separate regulator.
Increased processor memory bandwidth and DDR4 support	Up to 64-bit DDR4 memory at 2,400 Mbps support is available for the processor. The hard memory controller for the HPS comprises a multi-port front end that manages connections to a single port memory controller. The multi-port front end allows logic core and the HPS to share ports and thereby the available bandwidth of the memory controller.
Flexible I/O sharing	An advanced I/O pin muxing scheme allows improved sharing of I/O between the HPS and the core logic. The following types of I/O are available for SoC: • 17 dedicated I/Os—physically located inside the HPS block and are not accessible to logic within the core. The 17 dedicated I/Os are used for HPS clock, resets, and interfacing with boot devices, QSPI, and SD/MMC. • 48 direct shared I/O—located closest to the HPS block and are ideal for high speed HPS peripherals such as EMAC, USB, and others. There is one bank of 48 I/Os that supports direct sharing where the 48 I/Os can be shared 12 I/Os at a time. • Standard (shared) I/O—all standard I/Os can be shared by the HPS peripherals and any logic within the core. For designs where more than 48 I/Os are required to fully use all the peripherals in the HPS, these I/Os can be connected through the core logic.
EMAC core	Three EMAC cores are available in the HPS. The EMAC cores enable an application to support two redundant Ethernet connections; for example, backplane, or two EMAC cores for managing IEEE 1588 time stamp information while allowing a third EMAC core for debug and configuration. All three EMACs can potentially share the same time stamps, simplifying the 1588 time stamping implementation. A new serial time stamp interface allows core logic to access and read the time stamp values. The integrated EMAC controllers can be connected to external Ethernet PHY through the provided MDIO or I^{2}C interface.
On-chip memory	The on-chip memory is updated to 256 KB support and can support larger data sets and real time algorithms.
ECC enhancements	Improvements in L2 Cache ECC management allow identification of errors down to the address level. ECC enhancements also enable improved error injection and status reporting via the introduction of new memory mapped access to syndrome and data signals.
HPS to FPGA Interconnect Backbone	Although the HPS and the Logic Core can operate independently, they are tightly coupled via a high-bandwidth system interconnect built from high-performance ARM AMBA AXI bus bridges. IP bus masters in the FPGA fabric have access to HPS bus slaves via the FPGA-to-HPS interconnect. Similarly, HPS bus masters have access to bus slaves in the core fabric via the HPS-to-FPGA bridge. Both bridges are AMBA AXI-3 compliant and support simultaneous read and write transactions. Up to three masters within the core fabric can share the HPS SDRAM controller with the processor. Additionally, the processor can be used to configure the core fabric under program control via a dedicated 32-bit configuration port.
FPGA configuration and HPS booting	The FPGA fabric and HPS in the SoCs are powered independently. You can reduce the clock frequencies or gate the clocks to reduce dynamic power. You can configure the FPGA fabric and boot the HPS independently, in any order, providing you with more design flexibility.
Security	New security features have been introduced for anti-tamper management, secure boot, encryption (AES), and authentication (SHA).

The optional power reduction techniques in Intel Arria 10 devices include:

- **SmartVID**—a code is programmed into each device during manufacturing that allows a smart regulator to operate the device at lower core V_{CC} while maintaining performance

- **Programmable Power Technology**—non-critical timing paths are identified by the Intel Quartus Prime software and the logic in these paths is biased for low power instead of high performance

- **Low Static Power Options**—devices are available with either standard static power or low static power while maintaining performance

Furthermore, Intel Arria 10 devices feature Intel's industry-leading low power transceivers and include a number of hard IP blocks that not only reduce logic resources but also deliver substantial power savings compared to soft implementations. In general, hard IP blocks consume up to 90% less power than the equivalent soft logic implementations.

Incremental Compilation

The Intel Quartus Prime software incremental compilation feature reduces compilation time and helps preserve performance to ease timing closure. The incremental compilation feature enables the partial reconfiguration flow for Intel Arria 10 devices.

Incremental compilation supports top-down, bottom-up, and team-based design flows. This feature facilitates modular, hierarchical, and team-based design flows where different designers compile their respective design sections in parallel. Furthermore, different designers or IP providers can develop and optimize different blocks of the design independently. These blocks can then be imported into the top level project.

Document Revision History for Intel Arria 10 Device Overview

Document Version	Changes
2018.04.09	Updated the lowest V_{CC} from 0.83 V to 0.82 V in the topic listing a summary of the device features.

Date	Version	Changes
January 2018	2018.01.17	• Updated the maximum data rate for HPS (Intel Arria 10 SX devices external memory interface DDR3 controller from 2,166 Mbps to 2,133 Mbps. • Updated maximum frequency supported for half rate QDRII and QDRII + SRAM to 633 MHz in *Memory Standards Supported by the Soft Memory Controller* table. • Updated transceiver backplane capability to 12.5 Gbps. • Removed transceiver speed grade 5 in *Sample Ordering Core and Available Options for Intel Arria 10 GX Devices* figure.
		continued...

Date	Version	Changes
		• Removed package code 40, low static power, SmartVID, industrial, and military operating temperature support from *Sample Ordering Core and Available Options for Intel Arria 10 GT Devices* figure. • Updated short reach transceiver rate for Intel Arria 10 GT devices to 25.8 Gbps. • Removed On-Die Instrumentation — EyeQ and Jitter Margin Tool support from *PMA Features of the Transceivers in Intel Arria 10 Devices* table.
September 2017	2017.09.20	Updated the maximum speed of the DDR4 external memory interface from 1,333 MHz/2,666 Mbps to 1,200 MHz/2,400 Mbps.
July 2017	2017.07.13	Corrected the automotive temperature range in the figure showing the available options for the Intel Arria 10 GX devices from "-40°C to 100°C" to "-40°C to 125°C".
July 2017	2017.07.06	Added automotive temperature option to Intel Arria 10 GX device family.
May 2017	2017.05.08	• Corrected protocol names with "1588" to "IEEE 1588v2". • Updated the vertical migration table to remove vertical migration between Intel Arria 10 GX and Intel Arria 10 SX device variants. • Removed all "Preliminary" marks.
March 2017	2017.03.15	• Removed the topic about migration from Intel Arria 10 to Intel Stratix 10 devices. • Rebranded as Intel.
October 2016	2016.10.31	• Removed package F36 from Intel Arria 10 GX devices. • Updated Intel Arria 10 GT sample ordering code and maximum GX transceiver count. Intel Arria 10 GT devices are available only in the SF45 package option with a maximum of 72 transceivers.
May 2016	2016.05.02	• Updated the FPGA Configuration and HPS Booting topic. • Remove V_{CC} PowerManager from the Summary of Features, Power Management and Arria 10 Device Variants and packages topics. This feature is no longer supported in Arria 10 devices. • Removed LPDDR3 from the Memory Standards Supported by the HPS Hard Memory Controller table in the Memory Standards Supported by Intel Arria 10 Devices topic. This standard is only supported by the FPGA. • Removed transceiver speed grade 5 from the Device Variants and Packages topic for Arria 10 GX and SX devices.
February 2016	2016.02.11	• Changed the maximum Arria 10 GT datarate to 25.8 Gbps and the minimum datarate to 1 Gbps globally. • Revised the state for Core clock networks in the Summary of Features topic. • Changed the transceiver parameters in the "Summary of Features for Arria 10 Devices" table. • Changed the transceiver parameters in the "Maximum Resource Counts for Arria 10 GT Devices" table. • Changed the package availability for GT devices in the "Package Plan for Arria 10 GT Devices" table. • Changed the package configurations for GT devices in the "Migration Capability Across Arria 10 Product Lines" figure. • Changed transceiver parameters in the "Low Power Serial Transceivers" section. • Changed the transceiver descriptions in the "Device Variants for the Arria 10 Device Family" table. • Changed the "Sample Ordering Code and Available Options for Arria 10 GT Devices" figure. • Changed the datarates for GT devices in the "PMA Features" section. • Changed the datarates for GT devices in the "PCS Features" section.

continued...

Date	Version	Changes
December 2015	2015.12.14	• Updated the number of M20K memory blocks for Arria 10 GX 660 from 2133 to 2131 and corrected the total RAM bit from 48,448 Kb to 48,408 Kb. • Corrected the number of DSP blocks for Arria 10 GX 660 from 1688 to 1687 in the table listing floating-point arithmetic resources.
November 2015	2015.11.02	• Updated the maximum resources for Arria 10 GX 220, GX 320, GX 480, GX 660, SX 220, SX 320, SX 480, and SX 660. • Updated resource count for Arria 10 GX 320, GX 480, GX 660, SX 320, SX 480, a SX 660 devices in **Number of Multipliers in Intel Arria 10 Devices** table. • Updated the available options for Arria 10 GX, GT, and SX. • Changed instances of *Quartus II* to *Quartus Prime*.
June 2015	2015.06.15	Corrected label for Intel Arria 10 GT product lines in the vertical migration figure.
May 2015	2015.05.15	Corrected the DDR3 half rate and quarter rate maximum frequencies in the table that lists the memory standards supported by the Intel Arria 10 hard memory controller.
May 2015	2015.05.04	• Added support for 13.5G JESD204b in the Summary of Features table. • Added a link to Arria 10 GT Channel Usage in the Arria 10 GT Package Plan topic. • Added a note to the table, Maximum Resource Counts for Arria 10 GT devices. • Updated the power requirements of the transceivers in the Low Power Serial Transceivers topic.
January 2015	2015.01.23	• Added floating point arithmetic features in the Summary of Features table. • Updated the total embedded memory from 38.38 megabits (Mb) to 65.6 Mb. • Updated the table that lists the memory standards supported by Intel Arria 10 devices. • Removed support for DDR3U, LPDDR3 SDRAM, RLDRAM 2, and DDR2. • Moved RLDRAM 3 support from hard memory controller to soft memory controller. RLDRAM 3 support uses hard PHY with soft memory controller. • Added soft memory controller support for QDR IV. • Updated the maximum resource count table to include the number of hard memory controllers available in each device variant. • Updated the transceiver PCS data rate from 12.5 Gbps to 12 Gbps. • Updated the max clock rate of PS, FPP x8, FPP x16, and Configuration via HPS from 125 MHz to 100 MHz. • Added a feature for fractional synthesis PLLs: PLL cascading. • Updated the HPS programmable general-purpose I/Os from 54 to 62.
September 2014	2014.09.30	• Corrected the 3 V I/O and LVDS I/O counts for F35 and F36 packages of Arria 10 GX. • Corrected the 3 V I/O, LVDS I/O, and transceiver counts for the NF40 package of the Arria GX 570 and 660. • Removed 3 V I/O, LVDS I/O, and transceiver counts for the NF40 package of the Arria GX 900 and 1150. The NF40 package is not available for Arria 10 GX 900 and 1150.
