Welcome to E-XFL.COM

Embedded - System On Chip (SoC): The Heart of Modern Embedded Systems

Embedded - System On Chip (SoC) refers to an integrated circuit that consolidates all the essential components of a computer system into a single chip. This includes a microprocessor, memory, and other peripherals, all packed into one compact and efficient package. SoCs are designed to provide a complete computing solution, optimizing both space and power consumption, making them ideal for a wide range of embedded applications.

What are Embedded - System On Chip (SoC)?

System On Chip (SoC) integrates multiple functions of a computer or electronic system onto a single chip. Unlike traditional multi-chip solutions, SoCs combine a central

Details	
Product Status	Active
Architecture	MCU, FPGA
Core Processor	Dual ARM® Cortex®-A9 MPCore™ with CoreSight™
Flash Size	-
RAM Size	256KB
Peripherals	DMA, POR, WDT
Connectivity	EBI/EMI, Ethernet, I²C, MMC/SD/SDIO, SPI, UART/USART, USB OTG
Speed	1.5GHz
Primary Attributes	FPGA - 660K Logic Elements
Operating Temperature	0°C ~ 100°C (TJ)
Package / Case	1517-BBGA, FCBGA
Supplier Device Package	1517-FCBGA (40x40)
Purchase URL	https://www.e-xfl.com/product-detail/intel/10as066k3f40e2lg

Key Advantages of Intel Arria 10 Devices

Table 2. Key Advantages of the Intel Arria 10 Device Family

Advantage	Supporting Feature
Enhanced core architecture	• Built on TSMC's 20 nm process technology • 60% higher performance than the previous generation of mid-range FPGAs • 15% higher performance than the fastest previous-generation FPGA
High-bandwidth integrated transceivers	• Short-reach rates up to 25.8 Gigabits per second (Gbps) • Backplane capability up to 12.5 Gbps • Integrated 10GBASE-KR and 40GBASE-KR4 Forward Error Correction (FEC)
Improved logic integration and hard IP blocks	• 8-input adaptive logic module (ALM) • Up to 65.6 megabits (Mb) of embedded memory • Variable-precision digital signal processing (DSP) blocks • Fractional synthesis phase-locked loops (PLLs) • Hard PCI Express Gen3 IP blocks • Hard memory controllers and PHY up to 2,400 Megabits per second (Mbps)
Second generation hard processor system (HPS) with integrated ARM* Cortex*-A9* MPCore* processor	• Tight integration of a dual-core ARM Cortex-A9 MPCore processor, hard IP, and an FPGA in a single Intel Arria 10 system-on-a-chip (SoC) • Supports over 128 Gbps peak bandwidth with integrated data coherency between the processor and the FPGA fabric
Advanced power savings	• Comprehensive set of advanced power saving features • Power-optimized MultiTrack routing and core architecture • Up to 40% lower power compared to previous generation of mid-range FPGAs • Up to 60% lower power compared to previous generation of high-end FPGAs

Summary of Intel Arria 10 Features

Table 3. Summary of Features for Intel Arria 10 Devices

Feature	Description
Technology	• TSMC's 20-nm SoC process technology • Allows operation at a lower V_{CC} level of 0.82 V instead of the 0.9 V standard V_{CC} core voltage
Packaging	• 1.0 mm ball-pitch Fineline BGA packaging • 0.8 mm ball-pitch Ultra Fineline BGA packaging • Multiple devices with identical package footprints for seamless migration between different FPGA densities • Devices with compatible package footprints allow migration to next generation high-end Stratix® 10 devices • RoHS, leaded(1), and lead-free (Pb-free) options
High-performance FPGA fabric	• Enhanced 8-input ALM with four registers • Improved multi-track routing architecture to reduce congestion and improve compilation time • Hierarchical core clocking architecture • Fine-grained partial reconfiguration
Internal memory blocks	• M20K—20-Kb memory blocks with hard error correction code (ECC) • Memory logic array block (MLAB)—640-bit memory

(1) Contact Intel for availability.

Feature	Description	
Embedded Hard IP blocks	Variable-precision DSP	• Native support for signal processing precision levels from 18 x 19 to 54 x 54 • Native support for 27 x 27 multiplier mode • 64-bit accumulator and cascade for systolic finite impulse responses (FIRs) • Internal coefficient memory banks • Preadder/subtractor for improved efficiency • Additional pipeline register to increase performance and reduce power • Supports floating point arithmetic: — Perform multiplication, addition, subtraction, multiply-add, multiply-subtract, and complex multiplication. — Supports multiplication with accumulation capability, cascade summation, and cascade subtraction capability. — Dynamic accumulator reset control. — Support direct vector dot and complex multiplication chaining multiply floating point DSP blocks.
	Memory controller	DDR4, DDR3, and DDR3L
	PCI Express*	PCI Express (PCIe*) Gen3 (x1, x2, x4, or x8), Gen2 (x1, x2, x4, or x8) and Gen1 (x1, x2, x4, or x8) hard IP with complete protocol stack, endpoint, and root port
	Transceiver I/O	• 10GBASE-KR/40GBASE-KR4 Forward Error Correction (FEC) • PCS hard IPs that support: — 10-Gbps Ethernet (10GbE) — PCIe PIPE interface — Interlaken — Gbps Ethernet (GbE) — Common Public Radio Interface (CPRI) with deterministic latency support — Gigabit-capable passive optical network (GPON) with fast lock-time support • 13.5G JESD204b • 8B/10B, 64B/66B, 64B/67B encoders and decoders • Custom mode support for proprietary protocols
Core clock networks	• Up to 800 MHz fabric clocking, depending on the application: — 667 MHz external memory interface clocking with 2,400 Mbps DDR4 interface — 800 MHz LVDS interface clocking with 1,600 Mbps LVDS interface • Global, regional, and peripheral clock networks • Clock networks that are not used can be gated to reduce dynamic power	
Phase-locked loops (PLLs)	• High-resolution fractional synthesis PLLs: — Precision clock synthesis, clock delay compensation, and zero delay buffering (ZDB) — Support integer mode and fractional mode — Fractional mode support with third-order delta-sigma modulation • Integer PLLs: — Adjacent to general purpose I/Os — Support external memory and LVDS interfaces	
FPGA General-purpose I/Os (GPIOs)	• 1.6 Gbps LVDS—every pair can be configured as receiver or transmitter • On-chip termination (OCT) • 1.2 V to 3.0 V single-ended LVTTL/LVCMOS interfacing	
External Memory Interface	• Hard memory controller— DDR4, DDR3, and DDR3L support — DDR4—speeds up to 1,200 MHz/2,400 Mbps — DDR3—speeds up to 1,067 MHz/2,133 Mbps • Soft memory controller—provides support for RLDRAM 3(2), QDR IV(2), and QDR II+

Embedded Memory Blocks

The embedded memory blocks in the devices are flexible and designed to provide an optimal amount of small- and large-sized memory arrays to fit your design requirements.

Types of Embedded Memory

The Intel Arria 10 devices contain two types of memory blocks:

- 20 Kb M20K blocks—blocks of dedicated memory resources. The M20K blocks are ideal for larger memory arrays while still providing a large number of independent ports.
- 640 bit memory logic array blocks (MLABs)—enhanced memory blocks that are configured from dual-purpose logic array blocks (LABs). The MLABs are ideal for wide and shallow memory arrays. The MLABs are optimized for implementation of shift registers for digital signal processing (DSP) applications, wide and shallow FIFO buffers, and filter delay lines. Each MLAB is made up of ten adaptive logic modules (ALMs). In the Intel Arria 10 devices, you can configure these ALMs as ten 32 x 2 blocks, giving you one 32 x 20 simple dual-port SRAM block per MLAB.

Embedded Memory Capacity in Intel Arria 10 Devices

Table 18. Embedded Memory Capacity and Distribution in Intel Arria 10 Devices

Variant	Product Line	M20K		MLAB		Total RAM Bit (Kb)
		Block	RAM Bit (Kb)	Block	RAM Bit (Kb)	
Intel Arria 10 GX	GX 160	440	8,800	1,680	1,050	9,850
	GX 220	587	11,740	2,703	1,690	13,430
	GX 270	750	15,000	3,922	2,452	17,452
	GX 320	891	17,820	4,363	2,727	20,547

Intel Arria 10 SX	SX 160	440	8,800	1,680	1,050	9,850
	SX 220	587	11,740	2,703	1,690	13,430
	SX 270	750	15,000	3,922	2,452	17,452
	SX 320	891	17,820	4,363	2,727	20,547
	SX 480	1,431	28,620	6,662	4,164	32,784
	SX 570	1,800	36,000	8,153	5,096	41,096
	SX 660	2,131	42,620	9,260	5,788	48,408

Related Information

Intel Arria 10 Device Datasheet
Lists the memory interface performance according to memory interface standards, rank or chip select configurations, and Intel Arria 10 device speed grades.

PCIe Gen1, Gen2, and Gen3 Hard IP

Intel Arria 10 devices contain PCIe hard IP that is designed for performance and ease-of-use:

- Includes all layers of the PCIe stack—transaction, data link and physical layers.
- Supports PCIe Gen3, Gen2, and Gen1 Endpoint and Root Port in x1, x2, x4, or x8 lane configuration.
- Operates independently from the core logic—optional configuration via protocol (CvP) allows the PCIe link to power up and complete link training in less than 100 ms while the Intel Arria 10 device completes loading the programming file for the rest of the FPGA.
- Provides added functionality that makes it easier to support emerging features such as Single Root I/O Virtualization (SR-IOV) and optional protocol extensions.
- Provides improved end-to-end datapath protection using ECC.
- Supports FPGA configuration via protocol (CvP) using PCIe at Gen3, Gen2, or Gen1 speed.

Enhanced PCS Hard IP for Interlaken and 10 Gbps Ethernet

Interlaken Support

The Intel Arria 10 enhanced PCS hard IP provides integrated Interlaken PCS supporting rates up to 25.8 Gbps per lane.

The Interlaken PCS is based on the proven functionality of the PCS developed for Intel's previous generation FPGAs, which demonstrated interoperability with Interlaken ASSP vendors and third-party IP suppliers. The Interlaken PCS is present in every transceiver channel in Intel Arria 10 devices.

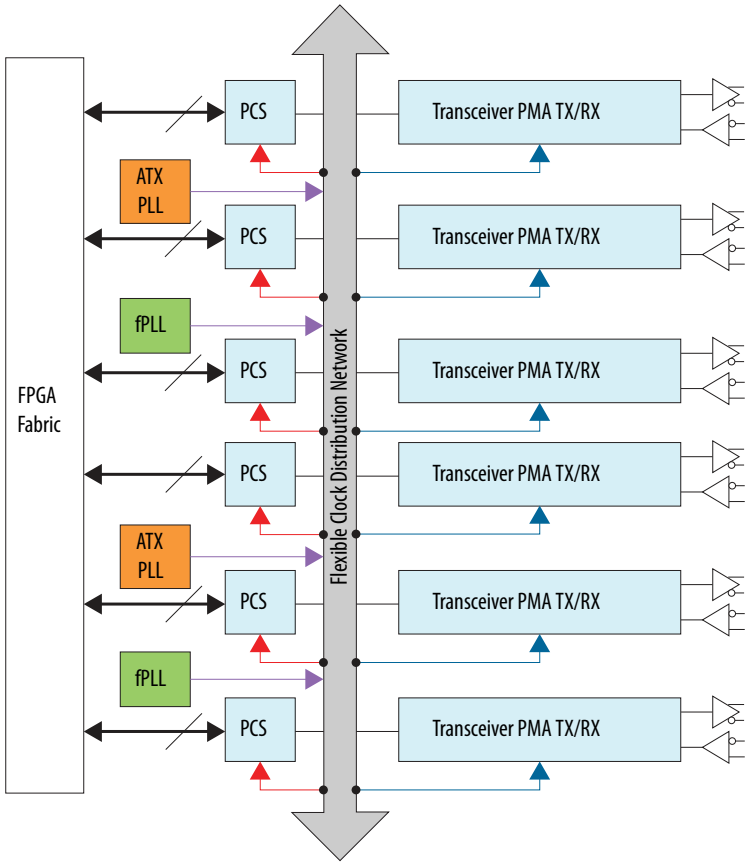
Related Information

PCS Features on page 30

10 Gbps Ethernet Support

The Intel Arria 10 enhanced PCS hard IP supports 10GBASE-R PCS compliant with IEEE 802.3 10 Gbps Ethernet (10GbE). The integrated hard IP support for 10GbE and the 10 Gbps transceivers save external PHY cost, board space, and system power.

Figure 6. Intel Arria 10 Transceiver Block Architecture



Transceiver Channels

All transceiver channels feature a dedicated Physical Medium Attachment (PMA) and a hardened Physical Coding Sublayer (PCS).

- The PMA provides primary interfacing capabilities to physical channels.
- The PCS typically handles encoding/decoding, word alignment, and other pre-processing functions before transferring data to the FPGA core fabric.

A transceiver channel consists of a PMA and a PCS block. Most transceiver banks have 6 channels. There are some transceiver banks that contain only 3 channels.

A wide variety of bonded and non-bonded data rate configurations is possible using a highly configurable clock distribution network. Up to 80 independent transceiver data rates can be configured.

The following figures are graphical representations of top views of the silicon die, which correspond to reverse views for flip chip packages. Different Intel Arria 10 devices may have different floorplans than the ones shown in the figures.

Each transceiver channel contains a channel PLL that can be used as the CMU PLL or clock data recovery (CDR) PLL. In CDR mode, the channel PLL recovers the receiver clock and data in the transceiver channel. Up to 80 independent data rates can be configured on a single Intel Arria 10 device.

Table 23. PMA Features of the Transceivers in Intel Arria 10 Devices

Feature	Capability
Chip-to-Chip Data Rates	1 Gbps to 17.4 Gbps (Intel Arria 10 GX devices) 1 Gbps to 25.8 Gbps (Intel Arria 10 GT devices)
Backplane Support	Drive backplanes at data rates up to 12.5 Gbps
Optical Module Support	SFP+/SFP, XFP, CXP, QSFP/QSFP28, CFP/CFP2/CFP4
Cable Driving Support	SFP+ Direct Attach, PCI Express over cable, eSATA
Transmit Pre-Emphasis	4-tap transmit pre-emphasis and de-emphasis to compensate for system channel loss
Continuous Time Linear Equalizer (CTLE)	Dual mode, high-gain, and high-data rate, linear receive equalization to compensate for system channel loss
Decision Feedback Equalizer (DFE)	7-fixed and 4-floating tap DFE to equalize backplane channel loss in the presence of crosstalk and noisy environments
Variable Gain Amplifier	Optimizes the signal amplitude prior to the CDR sampling and operates in fixed and adaptive modes
Altera Digital Adaptive Parametric Tuning (ADAPT)	Fully digital adaptation engine to automatically adjust all link equalization parameters—including CTLE, DFE, and variable gain amplifier blocks—that provide optimal link margin without intervention from user logic
Precision Signal Integrity Calibration Engine (PreSICE)	Hardened calibration controller to quickly calibrate all transceiver control parameters on power-up, which provides the optimal signal integrity and jitter performance
Advanced Transmit (ATX) PLL	Low jitter ATX (LC tank based) PLLs with continuous tuning range to cover a wide range of standard and proprietary protocols
Fractional PLLs	On-chip fractional frequency synthesizers to replace on-board crystal oscillators and reduce system cost
Digitally Assisted Analog CDR	Superior jitter tolerance with fast lock time
Dynamic Partial Reconfiguration	Allows independent control of the Avalon memory-mapped interface of each transceiver channel for the highest transceiver flexibility
Multiple PCS-PMA and PCS-PLD interface widths	8-, 10-, 16-, 20-, 32-, 40-, or 64-bit interface widths for flexibility of deserialization width, encoding, and reduced latency

PCS Features

This table summarizes the Intel Arria 10 transceiver PCS features. You can use the transceiver PCS to support a wide range of protocols ranging from 1 Gbps to 25.8 Gbps.

PCS	Description
Standard PCS	• Operates at a data rate up to 12 Gbps • Supports protocols such as PCI-Express, CPRI 4.2+, GigE, IEEE 1588 in Hard PCS • Implements other protocols using Basic/Custom (Standard PCS) transceiver configuration rules.
Enhanced PCS	• Performs functions common to most serial data industry standards, such as word alignment, encoding/decoding, and framing, before data is sent or received off-chip through the PMA • Handles data transfer to and from the FPGA fabric • Handles data transfer internally to and from the PMA • Provides frequency compensation • Performs channel bonding for multi-channel low skew applications
PCIe Gen3 PCS	• Supports the seamless switching of Data and Clock between the Gen1, Gen2, and Gen3 data rates • Provides support for PIPE 3.0 features • Supports the PIPE interface with the Hard IP enabled, as well as with the Hard IP bypassed

PCS Protocol Support

This table lists some of the protocols supported by the Intel Arria 10 transceiver PCS. For more information about the blocks in the transmitter and receiver data paths, refer to the related information.

Protocol	Data Rate (Gbps)	Transceiver IP	PCS Support
PCIe Gen3 x1, x2, x4, x8	8.0	Native PHY (PIPE)	Standard PCS and PCIe Gen3 PCS
PCIe Gen2 x1, x2, x4, x8	5.0	Native PHY (PIPE)	Standard PCS
PCIe Gen1 x1, x2, x4, x8	2.5	Native PHY (PIPE)	Standard PCS
1000BASE-X Gigabit Ethernet	1.25	Native PHY	Standard PCS
1000BASE-X Gigabit Ethernet with IEEE 1588v2	1.25	Native PHY	Standard PCS
10GBASE-R	10.3125	Native PHY	Enhanced PCS
10GBASE-R with IEEE 1588v2	10.3125	Native PHY	Enhanced PCS
10GBASE-R with KR FEC	10.3125	Native PHY	Enhanced PCS
10GBASE-KR and 1000BASE-X	10.3125	1G/10GbE and 10GBASE-KR PHY	Standard PCS and Enhanced PCS
Interlaken (CEI-6G/11G)	3.125 to 17.4	Native PHY	Enhanced PCS
SFI-S/SFI-5.2	11.2	Native PHY	Enhanced PCS
10G SDI	10.692	Native PHY	Enhanced PCS

Table 24. Improvements in 20 nm HPS

This table lists the key improvements of the 20 nm HPS compared to the 28 nm HPS.

Advantages/ Improvements	Description
Increased performance and overdrive capability	While the nominal processor frequency is 1.2 GHz, the 20 nm HPS offers an "overdrive" feature which enables a higher processor operating frequency. This requires a higher supply voltage value that is unique to the HPS and may require a separate regulator.
Increased processor memory bandwidth and DDR4 support	Up to 64-bit DDR4 memory at 2,400 Mbps support is available for the processor. The hard memory controller for the HPS comprises a multi-port front end that manages connections to a single port memory controller. The multi-port front end allows logic core and the HPS to share ports and thereby the available bandwidth of the memory controller.
Flexible I/O sharing	An advanced I/O pin muxing scheme allows improved sharing of I/O between the HPS and the core logic. The following types of I/O are available for SoC: • 17 dedicated I/Os—physically located inside the HPS block and are not accessible to logic within the core. The 17 dedicated I/Os are used for HPS clock, resets, and interfacing with boot devices, QSPI, and SD/MMC. • 48 direct shared I/O—located closest to the HPS block and are ideal for high speed HPS peripherals such as EMAC, USB, and others. There is one bank of 48 I/Os that supports direct sharing where the 48 I/Os can be shared 12 I/Os at a time. • Standard (shared) I/O—all standard I/Os can be shared by the HPS peripherals and any logic within the core. For designs where more than 48 I/Os are required to fully use all the peripherals in the HPS, these I/Os can be connected through the core logic.
EMAC core	Three EMAC cores are available in the HPS. The EMAC cores enable an application to support two redundant Ethernet connections; for example, backplane, or two EMAC cores for managing IEEE 1588 time stamp information while allowing a third EMAC core for debug and configuration. All three EMACs can potentially share the same time stamps, simplifying the 1588 time stamping implementation. A new serial time stamp interface allows core logic to access and read the time stamp values. The integrated EMAC controllers can be connected to external Ethernet PHY through the provided MDIO or I^2C interface.
On-chip memory	The on-chip memory is updated to 256 KB support and can support larger data sets and real time algorithms.
ECC enhancements	Improvements in L2 Cache ECC management allow identification of errors down to the address level. ECC enhancements also enable improved error injection and status reporting via the introduction of new memory mapped access to syndrome and data signals.
HPS to FPGA Interconnect Backbone	Although the HPS and the Logic Core can operate independently, they are tightly coupled via a high-bandwidth system interconnect built from high-performance ARM AMBA AXI bus bridges. IP bus masters in the FPGA fabric have access to HPS bus slaves via the FPGA-to-HPS interconnect. Similarly, HPS bus masters have access to bus slaves in the core fabric via the HPS-to-FPGA bridge. Both bridges are AMBA AXI-3 compliant and support simultaneous read and write transactions. Up to three masters within the core fabric can share the HPS SDRAM controller with the processor. Additionally, the processor can be used to configure the core fabric under program control via a dedicated 32-bit configuration port.
FPGA configuration and HPS booting	The FPGA fabric and HPS in the SoCs are powered independently. You can reduce the clock frequencies or gate the clocks to reduce dynamic power. You can configure the FPGA fabric and boot the HPS independently, in any order, providing you with more design flexibility.
Security	New security features have been introduced for anti-tamper management, secure boot, encryption (AES), and authentication (SHA).

Features of the HPS

The HPS has the following features:

- 1.2-GHz, dual-core ARM Cortex-A9 MPCore processor with up to 1.5-GHz via overdrive
  - — ARMv7-A architecture that runs 32-bit ARM instructions, 16-bit and 32-bit Thumb instructions, and 8-bit Java byte codes in Jazelle style
  - — Superscalar, variable length, out-of-order pipeline with dynamic branch prediction
  - — Instruction Efficiency 2.5 MIPS/MHz, which provides total performance of 7500 MIPS at 1.5 GHz
- Each processor core includes:
  - — 32 KB of L1 instruction cache, 32 KB of L1 data cache
  - — Single- and double-precision floating-point unit and NEON media engine
  - — CoreSight debug and trace technology
  - — Snoop Control Unit (SCU) and Acceleration Coherency Port (ACP)
- 512 KB of shared L2 cache
- 256 KB of scratch RAM
- Hard memory controller with support for DDR3, DDR4 and optional error correction code (ECC) support
- Multiport Front End (MPFE) Scheduler interface to the hard memory controller
- 8-channel direct memory access (DMA) controller
- QSPI flash controller with SIO, DIO, QIO SPI Flash support
- NAND flash controller (ONFI 1.0 or later) with DMA and ECC support, updated to support 8 and 16-bit Flash devices and new command DMA to offload CPU for fast power down recovery
- Updated SD/SDIO/MMC controller to eMMC 4.5 with DMA with CE-ATA digital command support
- 3 10/100/1000 Ethernet media access control (MAC) with DMA
- 2 USB On-the-Go (OTG) controllers with DMA
- 5 I^2C controllers (3 can be used by EMAC for MIO to external PHY)
- 2 UART 16550 Compatible controllers
- 4 serial peripheral interfaces (SPI) (2 Master, 2 Slaves)
- 62 programmable general-purpose I/Os, which includes 48 direct share I/Os that allows the HPS peripherals to connect directly to the FPGA I/Os
- 7 general-purpose timers
- 4 watchdog timers
- Anti-tamper, Secure Boot, Encryption (AES) and Authentication (SHA)

Instead of placing all device functions in the FPGA fabric, you can store some functions that do not run simultaneously in external memory and load them only when required. This capability increases the effective logic density of the device, and lowers cost and power consumption.

In the Intel solution, you do not have to worry about intricate device architecture to perform a partial reconfiguration. The partial reconfiguration capability is built into the Intel Quartus Prime design software, making such time-intensive task simple.

Intel Arria 10 devices support partial reconfiguration in the following configuration options:

- Using an internal host:
  - All supported configuration modes where the FPGA has access to external memory devices such as serial and parallel flash memory.
  - Configuration via Protocol [CvP (PCIe)]
- Using an external host—passive serial (PS), fast passive parallel (FPP) x8, FPP x16, and FPP x32 I/O interface.

Enhanced Configuration and Configuration via Protocol

Table 25. Configuration Schemes and Features of Intel Arria 10 Devices

Intel Arria 10 devices support 1.8 V programming voltage and several configuration schemes.

Scheme	Data Width	Max Clock Rate (MHz)	Max Data Rate (Mbps) (13)	Decompression	Design Security (14)	Partial Reconfiguration (15)	Remote System Update
JTAG	1 bit	33	33	—	—	Yes(16)	—
Active Serial (AS) through the EPCQ-L configuration device	1 bit, 4 bits	100	400	Yes	Yes	Yes(16)	Yes
Passive serial (PS) through CPLD or external microcontroller	1 bit	100	100	Yes	Yes	Yes(16)	Parallel Flash Loader (PFL) IP core

continued...

(13) Enabling either compression or design security features affects the maximum data rate. Refer to the Intel Arria 10 Device Datasheet for more information.

(14) Encryption and compression cannot be used simultaneously.

(15) Partial reconfiguration is an advanced feature of the device family. If you are interested in using partial reconfiguration, contact Intel for support.

(16) Partial configuration can be performed only when it is configured as internal host.

The optional power reduction techniques in Intel Arria 10 devices include:

- **SmartVID**—a code is programmed into each device during manufacturing that allows a smart regulator to operate the device at lower core V_{CC} while maintaining performance
- **Programmable Power Technology**—non-critical timing paths are identified by the Intel Quartus Prime software and the logic in these paths is biased for low power instead of high performance
- **Low Static Power Options**—devices are available with either standard static power or low static power while maintaining performance

Furthermore, Intel Arria 10 devices feature Intel's industry-leading low power transceivers and include a number of hard IP blocks that not only reduce logic resources but also deliver substantial power savings compared to soft implementations. In general, hard IP blocks consume up to 90% less power than the equivalent soft logic implementations.

Incremental Compilation

The Intel Quartus Prime software incremental compilation feature reduces compilation time and helps preserve performance to ease timing closure. The incremental compilation feature enables the partial reconfiguration flow for Intel Arria 10 devices.

Incremental compilation supports top-down, bottom-up, and team-based design flows. This feature facilitates modular, hierarchical, and team-based design flows where different designers compile their respective design sections in parallel. Furthermore, different designers or IP providers can develop and optimize different blocks of the design independently. These blocks can then be imported into the top level project.

Document Revision History for Intel Arria 10 Device Overview

Document Version	Changes
2018.04.09	Updated the lowest V_{CC} from 0.83 V to 0.82 V in the topic listing a summary of the device features.

Date	Version	Changes
January 2018	2018.01.17	• Updated the maximum data rate for HPS (Intel Arria 10 SX devices external memory interface DDR3 controller from 2,166 Mbps to 2,133 Mbps. • Updated maximum frequency supported for half rate QDRII and QDRII + SRAM to 633 MHz in *Memory Standards Supported by the Soft Memory Controller* table. • Updated transceiver backplane capability to 12.5 Gbps. • Removed transceiver speed grade 5 in *Sample Ordering Core and Available Options for Intel Arria 10 GX Devices* figure.

continued...

Date	Version	Changes
		• Removed package code 40, low static power, SmartVID, industrial, and military operating temperature support from *Sample Ordering Core and Available Options for Intel Arria 10 GT Devices* figure. • Updated short reach transceiver rate for Intel Arria 10 GT devices to 25.8 Gbps. • Removed On-Die Instrumentation — EyeQ and Jitter Margin Tool support from *PMA Features of the Transceivers in Intel Arria 10 Devices* table.
September 2017	2017.09.20	Updated the maximum speed of the DDR4 external memory interface from 1,333 MHz/2,666 Mbps to 1,200 MHz/2,400 Mbps.
July 2017	2017.07.13	Corrected the automotive temperature range in the figure showing the available options for the Intel Arria 10 GX devices from "-40°C to 100°C" to "-40°C to 125°C".
July 2017	2017.07.06	Added automotive temperature option to Intel Arria 10 GX device family.
May 2017	2017.05.08	• Corrected protocol names with "1588" to "IEEE 1588v2". • Updated the vertical migration table to remove vertical migration between Intel Arria 10 GX and Intel Arria 10 SX device variants. • Removed all "Preliminary" marks.
March 2017	2017.03.15	• Removed the topic about migration from Intel Arria 10 to Intel Stratix 10 devices. • Rebranded as Intel.
October 2016	2016.10.31	• Removed package F36 from Intel Arria 10 GX devices. • Updated Intel Arria 10 GT sample ordering code and maximum GX transceiver count. Intel Arria 10 GT devices are available only in the SF45 package option with a maximum of 72 transceivers.
May 2016	2016.05.02	• Updated the FPGA Configuration and HPS Booting topic. • Remove V_{CC} PowerManager from the Summary of Features, Power Management and Arria 10 Device Variants and packages topics. This feature is no longer supported in Arria 10 devices. • Removed LPDDR3 from the Memory Standards Supported by the HPS Hard Memory Controller table in the Memory Standards Supported by Intel Arria 10 Devices topic. This standard is only supported by the FPGA. • Removed transceiver speed grade 5 from the Device Variants and Packages topic for Arria 10 GX and SX devices.
February 2016	2016.02.11	• Changed the maximum Arria 10 GT datarate to 25.8 Gbps and the minimum datarate to 1 Gbps globally. • Revised the state for Core clock networks in the Summary of Features topic. • Changed the transceiver parameters in the "Summary of Features for Arria 10 Devices" table. • Changed the transceiver parameters in the "Maximum Resource Counts for Arria 10 GT Devices" table. • Changed the package availability for GT devices in the "Package Plan for Arria 10 GT Devices" table. • Changed the package configurations for GT devices in the "Migration Capability Across Arria 10 Product Lines" figure. • Changed transceiver parameters in the "Low Power Serial Transceivers" section. • Changed the transceiver descriptions in the "Device Variants for the Arria 10 Device Family" table. • Changed the "Sample Ordering Code and Available Options for Arria 10 GT Devices" figure. • Changed the datarates for GT devices in the "PMA Features" section. • Changed the datarates for GT devices in the "PCS Features" section.

continued...
