Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details

| | |
|--------------------------------|---|
| Product Status | Active |
| Number of LABs/CLBs | 217080 |
| Number of Logic Elements/Cells | 570000 |
| Total RAM Bits | 42082304 |
| Number of I/O | 696 |
| Number of Gates | - |
| Voltage - Supply | 0.87V ~ 0.98V |
| Mounting Type | Surface Mount |
| Operating Temperature | -40°C ~ 100°C (TJ) |
| Package / Case | 1517-BBGA, FCBGA |
| Supplier Device Package | 1517-FCBGA (40x40) |

Intel® Arria® 10 Device Overview

The Intel® Arria® 10 device family consists of high-performance and power-efficient 20 nm mid-range FPGAs and SoCs.

Intel Arria 10 device family delivers:

- Higher performance than the previous generation of mid-range and high-end FPGAs.
- Power efficiency attained through a comprehensive set of power-saving technologies.

The Intel Arria 10 devices are ideal for high performance, power-sensitive, midrange applications in diverse markets.

Table 1. Sample Markets and Ideal Applications for Intel Arria 10 Devices

| Market | Applications |
|-----------------------|---|
| Wireless | <ul style="list-style-type: none"> • Channel and switch cards in remote radio heads • Mobile backhaul |
| Wireline | <ul style="list-style-type: none"> • 40G/100G muxponders and transponders • 100G line cards • Bridging • Aggregation |
| Broadcast | <ul style="list-style-type: none"> • Studio switches • Servers and transport • Videoconferencing • Professional audio and video |
| Computing and Storage | <ul style="list-style-type: none"> • Flash cache • Cloud computing servers • Server acceleration |
| Medical | <ul style="list-style-type: none"> • Diagnostic scanners • Diagnostic imaging |
| Military | <ul style="list-style-type: none"> • Missile guidance and control • Radar • Electronic warfare • Secure communications |

Key Advantages of Intel Arria 10 Devices

Table 2. Key Advantages of the Intel Arria 10 Device Family

| Advantage | Supporting Feature |
|--|--|
| Enhanced core architecture | <ul style="list-style-type: none"> Built on TSMC's 20 nm process technology 60% higher performance than the previous generation of mid-range FPGAs 15% higher performance than the fastest previous-generation FPGA |
| High-bandwidth integrated transceivers | <ul style="list-style-type: none"> Short-reach rates up to 25.8 Gigabits per second (Gbps) Backplane capability up to 12.5 Gbps Integrated 10GBASE-KR and 40GBASE-KR4 Forward Error Correction (FEC) |
| Improved logic integration and hard IP blocks | <ul style="list-style-type: none"> 8-input adaptive logic module (ALM) Up to 65.6 megabits (Mb) of embedded memory Variable-precision digital signal processing (DSP) blocks Fractional synthesis phase-locked loops (PLLs) Hard PCI Express Gen3 IP blocks Hard memory controllers and PHY up to 2,400 Megabits per second (Mbps) |
| Second generation hard processor system (HPS) with integrated ARM* Cortex*-A9* MPCore* processor | <ul style="list-style-type: none"> Tight integration of a dual-core ARM Cortex-A9 MPCore processor, hard IP, and an FPGA in a single Intel Arria 10 system-on-a-chip (SoC) Supports over 128 Gbps peak bandwidth with integrated data coherency between the processor and the FPGA fabric |
| Advanced power savings | <ul style="list-style-type: none"> Comprehensive set of advanced power saving features Power-optimized MultiTrack routing and core architecture Up to 40% lower power compared to previous generation of mid-range FPGAs Up to 60% lower power compared to previous generation of high-end FPGAs |

Summary of Intel Arria 10 Features

Table 3. Summary of Features for Intel Arria 10 Devices

| Feature | Description |
|------------------------------|---|
| Technology | <ul style="list-style-type: none"> TSMC's 20-nm SoC process technology Allows operation at a lower V_{CC} level of 0.82 V instead of the 0.9 V standard V_{CC} core voltage |
| Packaging | <ul style="list-style-type: none"> 1.0 mm ball-pitch FINELINE BGA packaging 0.8 mm ball-pitch Ultra FINELINE BGA packaging Multiple devices with identical package footprints for seamless migration between different FPGA densities Devices with compatible package footprints allow migration to next generation high-end Stratix® 10 devices RoHS, leaded⁽¹⁾, and lead-free (Pb-free) options |
| High-performance FPGA fabric | <ul style="list-style-type: none"> Enhanced 8-input ALM with four registers Improved multi-track routing architecture to reduce congestion and improve compilation time Hierarchical core clocking architecture Fine-grained partial reconfiguration |
| Internal memory blocks | <ul style="list-style-type: none"> M20K—20-Kb memory blocks with hard error correction code (ECC) Memory logic array block (MLAB)—640-bit memory |

I/O Vertical Migration for Intel Arria 10 Devices

Figure 4. Migration Capability Across Intel Arria 10 Product Lines

- The arrows indicate the migration paths. The devices included in each vertical migration path are shaded. Devices with fewer resources in the same path have lighter shades.
- To achieve the full I/O migration across product lines in the same migration path, restrict I/Os and transceivers usage to match the product line with the lowest I/O and transceiver counts.
- An LVDS I/O bank in the source device may be mapped to a 3 V I/O bank in the target device. To use memory interface clock frequency higher than 533 MHz, assign external memory interface pins only to banks that are LVDS I/O in both devices.
- There may be nominal 0.15 mm package height difference between some product lines in the same package type.
- Some migration paths are not shown in the Intel Quartus Prime software **Pin Migration View**.

| Variant | Product Line | Package | | | | | | | | | | | |

Adaptive Logic Module

Intel Arria 10 devices use a 20 nm ALM as the basic building block of the logic fabric.

The ALM architecture is the same as the previous generation FPGAs, allowing for efficient implementation of logic functions and easy conversion of IP between the device generations.

The ALM, as shown in following figure, uses an 8-input fracturable look-up table (LUT) with four dedicated registers to help improve timing closure in register-rich designs and achieve an even higher design packing capability than the traditional two-register per LUT architecture.

Types of Embedded Memory

The Intel Arria 10 devices contain two types of memory blocks:

- 20 Kb M20K blocks—blocks of dedicated memory resources. The M20K blocks are ideal for larger memory arrays while still providing a large number of independent ports.
- 640 bit memory logic array blocks (MLABs)—enhanced memory blocks that are configured from dual-purpose logic array blocks (LABs). The MLABs are ideal for wide and shallow memory arrays. The MLABs are optimized for implementation of shift registers for digital signal processing (DSP) applications, wide and shallow FIFO buffers, and filter delay lines. Each MLAB is made up of ten adaptive logic modules (ALMs). In the Intel Arria 10 devices, you can configure these ALMs as ten 32 x 2 blocks, giving you one 32 x 20 simple dual-port SRAM block per MLAB.

Embedded Memory Capacity in Intel Arria 10 Devices

Table 18. Embedded Memory Capacity and Distribution in Intel Arria 10 Devices

| Variant | Product Line | M20K | | MLAB | | Total RAM Bit (Kb) |

- Series (R_S) and parallel (R_T) on-chip termination (OCT) for all I/O banks with OCT calibration to limit the termination impedance variation
- On-chip dynamic termination that has the ability to swap between series and parallel termination, depending on whether there is read or write on a common bus for signal integrity
- Easy timing closure support using the hard read FIFO in the input register path, and delay-locked loop (DLL) delay chain with fine and coarse architecture

External Memory Interface

Intel Arria 10 devices offer massive external memory bandwidth, with up to seven 32-bit DDR4 memory interfaces running at up to 2,400 Mbps. This bandwidth provides additional ease of design, lower power, and resource efficiencies of hardened high-performance memory controllers.

The memory interface within Intel Arria 10 FPGAs and SoCs delivers the highest performance and ease of use. You can configure up to a maximum width of 144 bits when using the hard or soft memory controllers. If required, you can bypass the hard memory controller and use a soft controller implemented in the user logic.

Each I/O contains a hardened DDR read/write path (PHY) capable of performing key memory interface functionality such as read/write leveling, FIFO buffering to lower latency and improve margin, timing calibration, and on-chip termination.

The timing calibration is aided by the inclusion of hard microcontrollers based on Intel's Nios® II technology, specifically tailored to control the calibration of multiple memory interfaces. This calibration allows the Intel Arria 10 device to compensate for any changes in process, voltage, or temperature either within the Intel Arria 10 device itself, or within the external memory device. The advanced calibration algorithms ensure maximum bandwidth and robust timing margin across all operating conditions.

In addition to parallel memory interfaces, Intel Arria 10 devices support serial memory technologies such as the Hybrid Memory Cube (HMC). The HMC is supported by the Intel Arria 10 high-speed serial transceivers which connect up to four HMC links, with each link running at data rates up to 15 Gbps.

Memory Standards Supported by Intel Arria 10 Devices

The I/Os are designed to provide high performance support for existing and emerging external memory standards.

Table 20. Memory Standards Supported by the Hard Memory Controller

This table lists the overall capability of the hard memory controller. For specific details, refer to the External Memory Interface Spec Estimator and Intel Arria 10 Device Datasheet.

| Memory Standard | Rate Support | Ping Pong PHY Support | Maximum Frequency (MHz) |
|-----------------|--------------|-----------------------|-------------------------|
| DDR4 SDRAM | Quarter rate | Yes | 1,067 |
| | | — | 1,200 |
| DDR3 SDRAM | Half rate | Yes | 533 |
| | | — | 667 |
| | Quarter rate | Yes | 1,067 |
| | | — | 1,067 |
| DDR3L SDRAM | Half rate | Yes | 533 |
| | | — | 667 |
| | Quarter rate | Yes | 933 |
| | | — | 933 |
| LPDDR3 SDRAM | Half rate | — | 533 |
| | Quarter rate | — | 800 |

Table 21. Memory Standards Supported by the Soft Memory Controller

| Memory Standard | Rate Support | Maximum Frequency (MHz) |
|-----------------------------|--------------|-------------------------|
| RLDRAM 3 ⁽¹¹⁾ | Quarter rate | 1,200 |
| QDR IV SRAM ⁽¹¹⁾ | Quarter rate | 1,067 |
| QDR II SRAM | Full rate | 333 |
| | Half rate | 633 |
| QDR II+ SRAM | Full rate | 333 |
| | Half rate | 633 |
| QDR II+ Xtreme SRAM | Full rate | 333 |
| | Half rate | 633 |

Table 22. Memory Standards Supported by the HPS Hard Memory Controller

The hard processor system (HPS) is available in Intel Arria 10 SoC devices only.

| Memory Standard | Rate Support | Maximum Frequency (MHz) |
|-----------------|--------------|-------------------------|
| DDR4 SDRAM | Half rate | 1,200 |
| DDR3 SDRAM | Half rate | 1,067 |
| DDR3L SDRAM | Half rate | 933 |

⁽¹¹⁾ Intel Arria 10 devices support this external memory interface using hard PHY with soft memory controller.

Related Information

[Intel Arria 10 Device Datasheet](#)

Lists the memory interface performance according to memory interface standards, rank or chip select configurations, and Intel Arria 10 device speed grades.

PCIe Gen1, Gen2, and Gen3 Hard IP

Intel Arria 10 devices contain PCIe hard IP that is designed for performance and ease-of-use:

- Includes all layers of the PCIe stack—transaction, data link and physical layers.
- Supports PCIe Gen3, Gen2, and Gen1 Endpoint and Root Port in x1, x2, x4, or x8 lane configuration.
- Operates independently from the core logic—optional configuration via protocol (CvP) allows the PCIe link to power up and complete link training in less than 100 ms while the Intel Arria 10 device completes loading the programming file for the rest of the FPGA.
- Provides added functionality that makes it easier to support emerging features such as Single Root I/O Virtualization (SR-IOV) and optional protocol extensions.
- Provides improved end-to-end datapath protection using ECC.
- Supports FPGA configuration via protocol (CvP) using PCIe at Gen3, Gen2, or Gen1 speed.

Enhanced PCS Hard IP for Interlaken and 10 Gbps Ethernet

Interlaken Support

The Intel Arria 10 enhanced PCS hard IP provides integrated Interlaken PCS supporting rates up to 25.8 Gbps per lane.

The Interlaken PCS is based on the proven functionality of the PCS developed for Intel's previous generation FPGAs, which demonstrated interoperability with Interlaken ASSP vendors and third-party IP suppliers. The Interlaken PCS is present in every transceiver channel in Intel Arria 10 devices.

Related Information

[PCS Features](#) on page 30

10 Gbps Ethernet Support

The Intel Arria 10 enhanced PCS hard IP supports 10GBASE-R PCS compliant with IEEE 802.3 10 Gbps Ethernet (10GbE). The integrated hard IP support for 10GbE and the 10 Gbps transceivers save external PHY cost, board space, and system power.

The scalable hard IP supports multiple independent 10GbE ports while using a single PLL for all the 10GBASE-R PCS instantiations, which saves on core logic resources and clock networks:

- Simplifies multiport 10GbE systems compared to XAUI interfaces that require an external XAUI-to-10G PHY.
- Incorporates Electronic Dispersion Compensation (EDC), which enables direct connection to standard 10 Gbps XFP and SFP+ pluggable optical modules.
- Supports backplane Ethernet applications and includes a hard 10GBASE-KR Forward Error Correction (FEC) circuit that you can use for 10 Gbps and 40 Gbps applications.

The 10 Gbps Ethernet PCS hard IP and 10GBASE-KR FEC are present in every transceiver channel.

Related Information

[PCS Features](#) on page 30

Low Power Serial Transceivers

Intel Arria 10 FPGAs and SoCs include lowest power transceivers that deliver high bandwidth, throughput and low latency.

Intel Arria 10 devices deliver the industry's lowest power consumption per transceiver channel:

- 12.5 Gbps transceivers at as low as 242 mW
- 10 Gbps transceivers at as low as 168 mW
- 6 Gbps transceivers at as low as 117 mW

Intel Arria 10 transceivers support various data rates according to application:

- Chip-to-chip and chip-to-module applications—from 1 Gbps up to 25.8 Gbps
- Long reach and backplane applications—from 1 Gbps up to 12.5 with advanced adaptive equalization
- Critical power sensitive applications—from 1 Gbps up to 11.3 Gbps using lower power modes

The combination of 20 nm process technology and architectural advances provide the following benefits:

- Significant reduction in die area and power consumption
- Increase of up to two times in transceiver I/O density compared to previous generation devices while maintaining optimal signal integrity
- Up to 72 total transceiver channels—you can configure up to 6 of these channels to run as fast as 25.8 Gbps
- All channels feature continuous data rate support up to the maximum rated speed

Each transceiver channel contains a channel PLL that can be used as the CMU PLL or clock data recovery (CDR) PLL. In CDR mode, the channel PLL recovers the receiver clock and data in the transceiver channel. Up to 80 independent data rates can be configured on a single Intel Arria 10 device.

Table 23. PMA Features of the Transceivers in Intel Arria 10 Devices

| Feature | Capability |
|---|--|
| Chip-to-Chip Data Rates | 1 Gbps to 17.4 Gbps (Intel Arria 10 GX devices) 1 Gbps to 25.8 Gbps (Intel Arria 10 GT devices) |
| Backplane Support | Drive backplanes at data rates up to 12.5 Gbps |
| Optical Module Support | SFP+/SFP, XFP, CXP, QSFP/QSFP28, CFP/CFP2/CFP4 |
| Cable Driving Support | SFP+ Direct Attach, PCI Express over cable, eSATA |
| Transmit Pre-Emphasis | 4-tap transmit pre-emphasis and de-emphasis to compensate for system channel loss |
| Continuous Time Linear Equalizer (CTLE) | Dual mode, high-gain, and high-data rate, linear receive equalization to compensate for system channel loss |
| Decision Feedback Equalizer (DFE) | 7-fixed and 4-floating tap DFE to equalize backplane channel loss in the presence of crosstalk and noisy environments |
| Variable Gain Amplifier | Optimizes the signal amplitude prior to the CDR sampling and operates in fixed and adaptive modes |
| Altera Digital Adaptive Parametric Tuning (ADAPT) | Fully digital adaptation engine to automatically adjust all link equalization parameters—including CTLE, DFE, and variable gain amplifier blocks—that provide optimal link margin without intervention from user logic |
| Precision Signal Integrity Calibration Engine (PreSICE) | Hardened calibration controller to quickly calibrate all transceiver control parameters on power-up, which provides the optimal signal integrity and jitter performance |
| Advanced Transmit (ATX) PLL | Low jitter ATX (LC tank based) PLLs with continuous tuning range to cover a wide range of standard and proprietary protocols |
| Fractional PLLs | On-chip fractional frequency synthesizers to replace on-board crystal oscillators and reduce system cost |
| Digitally Assisted Analog CDR | Superior jitter tolerance with fast lock time |
| Dynamic Partial Reconfiguration | Allows independent control of the Avalon memory-mapped interface of each transceiver channel for the highest transceiver flexibility |
| Multiple PCS-PMA and PCS-PLD interface widths | 8-, 10-, 16-, 20-, 32-, 40-, or 64-bit interface widths for flexibility of deserialization width, encoding, and reduced latency |

PCS Features

This table summarizes the Intel Arria 10 transceiver PCS features. You can use the transceiver PCS to support a wide range of protocols ranging from 1 Gbps to 25.8 Gbps.

| PCS | Description |
|---------------|--|
| Standard PCS | <ul style="list-style-type: none"> Operates at a data rate up to 12 Gbps Supports protocols such as PCI-Express, CPRI 4.2+, GigE, IEEE 1588 in Hard PCS Implements other protocols using Basic/Custom (Standard PCS) transceiver configuration rules. |
| Enhanced PCS | <ul style="list-style-type: none"> Performs functions common to most serial data industry standards, such as word alignment, encoding/decoding, and framing, before data is sent or received off-chip through the PMA Handles data transfer to and from the FPGA fabric Handles data transfer internally to and from the PMA Provides frequency compensation Performs channel bonding for multi-channel low skew applications |
| PCIe Gen3 PCS | <ul style="list-style-type: none"> Supports the seamless switching of Data and Clock between the Gen1, Gen2, and Gen3 data rates Provides support for PIPE 3.0 features Supports the PIPE interface with the Hard IP enabled, as well as with the Hard IP bypassed |

Table 24. Improvements in 20 nm HPS

This table lists the key improvements of the 20 nm HPS compared to the 28 nm HPS.

| Advantages/ Improvements | Description |
|---|--|
| Increased performance and overdrive capability | While the nominal processor frequency is 1.2 GHz, the 20 nm HPS offers an “overdrive” feature which enables a higher processor operating frequency. This requires a higher supply voltage value that is unique to the HPS and may require a separate regulator. |
| Increased processor memory bandwidth and DDR4 support | Up to 64-bit DDR4 memory at 2,400 Mbps support is available for the processor. The hard memory controller for the HPS comprises a multi-port front end that manages connections to a single port memory controller. The multi-port front end allows logic core and the HPS to share ports and thereby the available bandwidth of the memory controller. |
| Flexible I/O sharing | <p>An advanced I/O pin muxing scheme allows improved sharing of I/O between the HPS and the core logic. The following types of I/O are available for SoC:</p> <ul style="list-style-type: none"> • 17 dedicated I/Os—physically located inside the HPS block and are not accessible to logic within the core. The 17 dedicated I/Os are used for HPS clock, resets, and interfacing with boot devices, QSPI, and SD/MMC. • 48 direct shared I/O—located closest to the HPS block and are ideal for high speed HPS peripherals such as EMAC, USB, and others. There is one bank of 48 I/Os that supports direct sharing where the 48 I/Os can be shared 12 I/Os at a time. • Standard (shared) I/O—all standard I/Os can be shared by the HPS peripherals and any logic within the core. For designs where more than 48 I/Os are required to fully use all the peripherals in the HPS, these I/Os can be connected through the core logic. |
| EMAC core | Three EMAC cores are available in the HPS. The EMAC cores enable an application to support two redundant Ethernet connections; for example, backplane, or two EMAC cores for managing IEEE 1588 time stamp information while allowing a third EMAC core for debug and configuration. All three EMACs can potentially share the same time stamps, simplifying the 1588 time stamping implementation. A new serial time stamp interface allows core logic to access and read the time stamp values. The integrated EMAC controllers can be connected to external Ethernet PHY through the provided MDIO or I ² C interface. |
| On-chip memory | The on-chip memory is updated to 256 KB support and can support larger data sets and real time algorithms. |
| ECC enhancements | Improvements in L2 Cache ECC management allow identification of errors down to the address level. ECC enhancements also enable improved error injection and status reporting via the introduction of new memory mapped access to syndrome and data signals. |
| HPS to FPGA Interconnect Backbone | Although the HPS and the Logic Core can operate independently, they are tightly coupled via a high-bandwidth system interconnect built from high-performance ARM AMBA AXI bus bridges. IP bus masters in the FPGA fabric have access to HPS bus slaves via the FPGA-to-HPS interconnect. Similarly, HPS bus masters have access to bus slaves in the core fabric via the HPS-to-FPGA bridge. Both bridges are AMBA AXI-3 compliant and support simultaneous read and write transactions. Up to three masters within the core fabric can share the HPS SDRAM controller with the processor. Additionally, the processor can be used to configure the core fabric under program control via a dedicated 32-bit configuration port. |
| FPGA configuration and HPS booting | <p>The FPGA fabric and HPS in the SoCs are powered independently. You can reduce the clock frequencies or gate the clocks to reduce dynamic power.</p> <p>You can configure the FPGA fabric and boot the HPS independently, in any order, providing you with more design flexibility.</p> |
| Security | New security features have been introduced for anti-tamper management, secure boot, encryption (AES), and authentication (SHA). |
