### Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

#### Details

Product Status	Active
Number of LABs/CLBs	217080
Number of Logic Elements/Cells	570000
Total RAM Bits	42082304
Number of I/O	588
Number of Gates	-
Voltage - Supply	0.87V ~ 0.93V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 100°C (TJ)
Package / Case	1517-BBGA, FCBGA
Supplier Device Package	1517-FCBGA (40x40)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/intel/10ax057n3f40e2lg">https://www.e-xfl.com/product-detail/intel/10ax057n3f40e2lg</a>

## Intel® Arria® 10 Device Overview

The Intel® Arria® 10 device family consists of high-performance and power-efficient 20 nm mid-range FPGAs and SoCs.

Intel Arria 10 device family delivers:

- Higher performance than the previous generation of mid-range and high-end FPGAs.
- Power efficiency attained through a comprehensive set of power-saving technologies.

The Intel Arria 10 devices are ideal for high performance, power-sensitive, midrange applications in diverse markets.

**Table 1. Sample Markets and Ideal Applications for Intel Arria 10 Devices**

Market	Applications
Wireless	<ul style="list-style-type: none"> <li>• Channel and switch cards in remote radio heads</li> <li>• Mobile backhaul</li> </ul>
Wireline	<ul style="list-style-type: none"> <li>• 40G/100G muxponders and transponders</li> <li>• 100G line cards</li> <li>• Bridging</li> <li>• Aggregation</li> </ul>
Broadcast	<ul style="list-style-type: none"> <li>• Studio switches</li> <li>• Servers and transport</li> <li>• Videoconferencing</li> <li>• Professional audio and video</li> </ul>
Computing and Storage	<ul style="list-style-type: none"> <li>• Flash cache</li> <li>• Cloud computing servers</li> <li>• Server acceleration</li> </ul>
Medical	<ul style="list-style-type: none"> <li>• Diagnostic scanners</li> <li>• Diagnostic imaging</li> </ul>
Military	<ul style="list-style-type: none"> <li>• Missile guidance and control</li> <li>• Radar</li> <li>• Electronic warfare</li> <li>• Secure communications</li> </ul>

## Key Advantages of Intel Arria 10 Devices

**Table 2. Key Advantages of the Intel Arria 10 Device Family**

Advantage	Supporting Feature
Enhanced core architecture	<ul style="list-style-type: none"><li>Built on TSMC's 20 nm process technology</li><li>60% higher performance than the previous generation of mid-range FPGAs</li><li>15% higher performance than the fastest previous-generation FPGA</li></ul>
High-bandwidth integrated transceivers	<ul style="list-style-type: none"><li>Short-reach rates up to 25.8 Gigabits per second (Gbps)</li><li>Backplane capability up to 12.5 Gbps</li><li>Integrated 10GBASE-KR and 40GBASE-KR4 Forward Error Correction (FEC)</li></ul>
Improved logic integration and hard IP blocks	<ul style="list-style-type: none"><li>8-input adaptive logic module (ALM)</li><li>Up to 65.6 megabits (Mb) of embedded memory</li><li>Variable-precision digital signal processing (DSP) blocks</li><li>Fractional synthesis phase-locked loops (PLLs)</li><li>Hard PCI Express Gen3 IP blocks</li><li>Hard memory controllers and PHY up to 2,400 Megabits per second (Mbps)</li></ul>
Second generation hard processor system (HPS) with integrated ARM* Cortex*-A9* MPCore* processor	<ul style="list-style-type: none"><li>Tight integration of a dual-core ARM Cortex-A9 MPCore processor, hard IP, and an FPGA in a single Intel Arria 10 system-on-a-chip (SoC)</li><li>Supports over 128 Gbps peak bandwidth with integrated data coherency between the processor and the FPGA fabric</li></ul>
Advanced power savings	<ul style="list-style-type: none"><li>Comprehensive set of advanced power saving features</li><li>Power-optimized MultiTrack routing and core architecture</li><li>Up to 40% lower power compared to previous generation of mid-range FPGAs</li><li>Up to 60% lower power compared to previous generation of high-end FPGAs</li></ul>

## Summary of Intel Arria 10 Features

**Table 3. Summary of Features for Intel Arria 10 Devices**

Feature	Description
Technology	<ul style="list-style-type: none"><li>TSMC's 20-nm SoC process technology</li><li>Allows operation at a lower <math>V_{CC}</math> level of 0.82 V instead of the 0.9 V standard <math>V_{CC}</math> core voltage</li></ul>
Packaging	<ul style="list-style-type: none"><li>1.0 mm ball-pitch FINELINE BGA packaging</li><li>0.8 mm ball-pitch Ultra FINELINE BGA packaging</li><li>Multiple devices with identical package footprints for seamless migration between different FPGA densities</li><li>Devices with compatible package footprints allow migration to next generation high-end Stratix® 10 devices</li><li>RoHS, leaded<sup>(1)</sup>, and lead-free (Pb-free) options</li></ul>
High-performance FPGA fabric	<ul style="list-style-type: none"><li>Enhanced 8-input ALM with four registers</li><li>Improved multi-track routing architecture to reduce congestion and improve compilation time</li><li>Hierarchical core clocking architecture</li><li>Fine-grained partial reconfiguration</li></ul>
Internal memory blocks	<ul style="list-style-type: none"><li>M20K—20-Kb memory blocks with hard error correction code (ECC)</li><li>Memory logic array block (MLAB)—640-bit memory</li></ul>

## Variable-Precision DSP Block

The Intel Arria 10 variable precision DSP blocks support fixed-point arithmetic and floating-point arithmetic.

Features for fixed-point arithmetic:

- High-performance, power-optimized, and fully registered multiplication operations
- 18-bit and 27-bit word lengths
- Two 18 x 19 multipliers or one 27 x 27 multiplier per DSP block
- Built-in addition, subtraction, and 64-bit double accumulation register to combine multiplication results
- Cascading 19-bit or 27-bit when pre-adder is disabled and cascading 18-bit when pre-adder is used to form the tap-delay line for filtering applications
- Cascading 64-bit output bus to propagate output results from one block to the next block without external logic support
- Hard pre-adder supported in 19-bit and 27-bit modes for symmetric filters
- Internal coefficient register bank in both 18-bit and 27-bit modes for filter implementation
- 18-bit and 27-bit systolic finite impulse response (FIR) filters with distributed output adder
- Biased rounding support

Features for floating-point arithmetic:

- A completely hardened architecture that supports multiplication, addition, subtraction, multiply-add, and multiply-subtract
- Multiplication with accumulation capability and a dynamic accumulator reset control
- Multiplication with cascade summation capability
- Multiplication with cascade subtraction capability
- Complex multiplication
- Direct vector dot product
- Systolic FIR filter

**Table 15. Variable-Precision DSP Block Configurations for Intel Arria 10 Devices**

Usage Example	Multiplier Size (Bit)	DSP Block Resources
Medium precision fixed point	Two 18 x 19	1
High precision fixed or Single precision floating point	One 27 x 27	1
Fixed point FFTs	One 19 x 36 with external adder	1
Very high precision fixed point	One 36 x 36 with external adder	2
Double precision floating point	One 54 x 54 with external adder	4

**Table 16. Resources for Fixed-Point Arithmetic in Intel Arria 10 Devices**

The table lists the variable-precision DSP resources by bit precision for each Intel Arria 10 device.

Variant	Product Line	Variable-precision DSP Block	Independent Input and Output Multiplications Operator		18 x 19 Multiplier Adder Sum Mode	18 x 18 Multiplier Adder Summed with 36 bit Input
			18 x 19 Multiplier	27 x 27 Multiplier		
Intel Arria 10 GX	GX 160	156	312	156	156	156
	GX 220	192	384	192	192	192
	GX 270	830	1,660	830	830	830
	GX 320	984	1,968	984	984	984
	GX 480	1,368	2,736	1,368	1,368	1,368
	GX 570	1,523	3,046	1,523	1,523	1,523
	GX 660	1,687	3,374	1,687	1,687	1,687
	GX 900	1,518	3,036	1,518	1,518	1,518
	GX 1150	1,518	3,036	1,518	1,518	1,518
Intel Arria 10 GT	GT 900	1,518	3,036	1,518	1,518	1,518
	GT 1150	1,518	3,036	1,518	1,518	1,518
Intel Arria 10 SX	SX 160	156	312	156	156	156
	SX 220	192	384	192	192	192
	SX 270	830	1,660	830	830	830

*continued...*

- Series ( $R_S$ ) and parallel ( $R_T$ ) on-chip termination (OCT) for all I/O banks with OCT calibration to limit the termination impedance variation
- On-chip dynamic termination that has the ability to swap between series and parallel termination, depending on whether there is read or write on a common bus for signal integrity
- Easy timing closure support using the hard read FIFO in the input register path, and delay-locked loop (DLL) delay chain with fine and coarse architecture

## External Memory Interface

Intel Arria 10 devices offer massive external memory bandwidth, with up to seven 32-bit DDR4 memory interfaces running at up to 2,400 Mbps. This bandwidth provides additional ease of design, lower power, and resource efficiencies of hardened high-performance memory controllers.

The memory interface within Intel Arria 10 FPGAs and SoCs delivers the highest performance and ease of use. You can configure up to a maximum width of 144 bits when using the hard or soft memory controllers. If required, you can bypass the hard memory controller and use a soft controller implemented in the user logic.

Each I/O contains a hardened DDR read/write path (PHY) capable of performing key memory interface functionality such as read/write leveling, FIFO buffering to lower latency and improve margin, timing calibration, and on-chip termination.

The timing calibration is aided by the inclusion of hard microcontrollers based on Intel's Nios® II technology, specifically tailored to control the calibration of multiple memory interfaces. This calibration allows the Intel Arria 10 device to compensate for any changes in process, voltage, or temperature either within the Intel Arria 10 device itself, or within the external memory device. The advanced calibration algorithms ensure maximum bandwidth and robust timing margin across all operating conditions.

In addition to parallel memory interfaces, Intel Arria 10 devices support serial memory technologies such as the Hybrid Memory Cube (HMC). The HMC is supported by the Intel Arria 10 high-speed serial transceivers which connect up to four HMC links, with each link running at data rates up to 15 Gbps.

### Related Information

#### [External Memory Interface Spec Estimator](#)

Provides a parametric tool that allows you to find and compare the performance of the supported external memory interfaces in IntelFPGAs.

## Memory Standards Supported by Intel Arria 10 Devices

The I/Os are designed to provide high performance support for existing and emerging external memory standards.

### **Related Information**

#### [Intel Arria 10 Device Datasheet](#)

Lists the memory interface performance according to memory interface standards, rank or chip select configurations, and Intel Arria 10 device speed grades.

## **PCIe Gen1, Gen2, and Gen3 Hard IP**

Intel Arria 10 devices contain PCIe hard IP that is designed for performance and ease-of-use:

- Includes all layers of the PCIe stack—transaction, data link and physical layers.
- Supports PCIe Gen3, Gen2, and Gen1 Endpoint and Root Port in x1, x2, x4, or x8 lane configuration.
- Operates independently from the core logic—optional configuration via protocol (CvP) allows the PCIe link to power up and complete link training in less than 100 ms while the Intel Arria 10 device completes loading the programming file for the rest of the FPGA.
- Provides added functionality that makes it easier to support emerging features such as Single Root I/O Virtualization (SR-IOV) and optional protocol extensions.
- Provides improved end-to-end datapath protection using ECC.
- Supports FPGA configuration via protocol (CvP) using PCIe at Gen3, Gen2, or Gen1 speed.

### **Related Information**

[PCS Features](#) on page 30

## **Enhanced PCS Hard IP for Interlaken and 10 Gbps Ethernet**

### **Interlaken Support**

The Intel Arria 10 enhanced PCS hard IP provides integrated Interlaken PCS supporting rates up to 25.8 Gbps per lane.

The Interlaken PCS is based on the proven functionality of the PCS developed for Intel's previous generation FPGAs, which demonstrated interoperability with Interlaken ASSP vendors and third-party IP suppliers. The Interlaken PCS is present in every transceiver channel in Intel Arria 10 devices.

### **Related Information**

[PCS Features](#) on page 30

### **10 Gbps Ethernet Support**

The Intel Arria 10 enhanced PCS hard IP supports 10GBASE-R PCS compliant with IEEE 802.3 10 Gbps Ethernet (10GbE). The integrated hard IP support for 10GbE and the 10 Gbps transceivers save external PHY cost, board space, and system power.

The scalable hard IP supports multiple independent 10GbE ports while using a single PLL for all the 10GBASE-R PCS instantiations, which saves on core logic resources and clock networks:

- Simplifies multiport 10GbE systems compared to XAUI interfaces that require an external XAUI-to-10G PHY.
- Incorporates Electronic Dispersion Compensation (EDC), which enables direct connection to standard 10 Gbps XFP and SFP+ pluggable optical modules.
- Supports backplane Ethernet applications and includes a hard 10GBASE-KR Forward Error Correction (FEC) circuit that you can use for 10 Gbps and 40 Gbps applications.

The 10 Gbps Ethernet PCS hard IP and 10GBASE-KR FEC are present in every transceiver channel.

#### **Related Information**

[PCS Features](#) on page 30

## **Low Power Serial Transceivers**

Intel Arria 10 FPGAs and SoCs include lowest power transceivers that deliver high bandwidth, throughput and low latency.

Intel Arria 10 devices deliver the industry's lowest power consumption per transceiver channel:

- 12.5 Gbps transceivers at as low as 242 mW
- 10 Gbps transceivers at as low as 168 mW
- 6 Gbps transceivers at as low as 117 mW

Intel Arria 10 transceivers support various data rates according to application:

- Chip-to-chip and chip-to-module applications—from 1 Gbps up to 25.8 Gbps
- Long reach and backplane applications—from 1 Gbps up to 12.5 with advanced adaptive equalization
- Critical power sensitive applications—from 1 Gbps up to 11.3 Gbps using lower power modes

The combination of 20 nm process technology and architectural advances provide the following benefits:

- Significant reduction in die area and power consumption
- Increase of up to two times in transceiver I/O density compared to previous generation devices while maintaining optimal signal integrity
- Up to 72 total transceiver channels—you can configure up to 6 of these channels to run as fast as 25.8 Gbps
- All channels feature continuous data rate support up to the maximum rated speed

Figure 6. Intel Arria 10 Transceiver Block Architecture

## Transceiver Channels

All transceiver channels feature a dedicated Physical Medium Attachment (PMA) and a hardened Physical Coding Sublayer (PCS).

- The PMA provides primary interfacing capabilities to physical channels.
- The PCS typically handles encoding/decoding, word alignment, and other pre-processing functions before transferring data to the FPGA core fabric.

A transceiver channel consists of a PMA and a PCS block. Most transceiver banks have 6 channels. There are some transceiver banks that contain only 3 channels.

A wide variety of bonded and non-bonded data rate configurations is possible using a highly configurable clock distribution network. Up to 80 independent transceiver data rates can be configured.

The following figures are graphical representations of top views of the silicon die, which correspond to reverse views for flip chip packages. Different Intel Arria 10 devices may have different floorplans than the ones shown in the figures.

**Figure 9. HPS Block Diagram**

This figure shows a block diagram of the HPS with the dual ARM Cortex-A9 MPCore processor.

## Key Advantages of 20-nm HPS

The 20-nm HPS strikes a balance between enabling maximum software compatibility with 28-nm SoCs while still improving upon the 28-nm HPS architecture. These improvements address the requirements of the next generation target markets such as wireless and wireline communications, compute and storage equipment, broadcast and military in terms of performance, memory bandwidth, connectivity via backplane and security.

**Table 24. Improvements in 20 nm HPS**

This table lists the key improvements of the 20 nm HPS compared to the 28 nm HPS.

Advantages/ Improvements	Description
Increased performance and overdrive capability	While the nominal processor frequency is 1.2 GHz, the 20 nm HPS offers an “overdrive” feature which enables a higher processor operating frequency. This requires a higher supply voltage value that is unique to the HPS and may require a separate regulator.
Increased processor memory bandwidth and DDR4 support	Up to 64-bit DDR4 memory at 2,400 Mbps support is available for the processor. The hard memory controller for the HPS comprises a multi-port front end that manages connections to a single port memory controller. The multi-port front end allows logic core and the HPS to share ports and thereby the available bandwidth of the memory controller.
Flexible I/O sharing	An advanced I/O pin muxing scheme allows improved sharing of I/O between the HPS and the core logic. The following types of I/O are available for SoC: <ul style="list-style-type: none"><li>• 17 dedicated I/Os—physically located inside the HPS block and are not accessible to logic within the core. The 17 dedicated I/Os are used for HPS clock, resets, and interfacing with boot devices, QSPI, and SD/MMC.</li><li>• 48 direct shared I/O—located closest to the HPS block and are ideal for high speed HPS peripherals such as EMAC, USB, and others. There is one bank of 48 I/Os that supports direct sharing where the 48 I/Os can be shared 12 I/Os at a time.</li><li>• Standard (shared) I/O—all standard I/Os can be shared by the HPS peripherals and any logic within the core. For designs where more than 48 I/Os are required to fully use all the peripherals in the HPS, these I/Os can be connected through the core logic.</li></ul>
EMAC core	Three EMAC cores are available in the HPS. The EMAC cores enable an application to support two redundant Ethernet connections; for example, backplane, or two EMAC cores for managing IEEE 1588 time stamp information while allowing a third EMAC core for debug and configuration. All three EMACs can potentially share the same time stamps, simplifying the 1588 time stamping implementation. A new serial time stamp interface allows core logic to access and read the time stamp values. The integrated EMAC controllers can be connected to external Ethernet PHY through the provided MDIO or I <sup>2</sup> C interface.
On-chip memory	The on-chip memory is updated to 256 KB support and can support larger data sets and real time algorithms.
ECC enhancements	Improvements in L2 Cache ECC management allow identification of errors down to the address level. ECC enhancements also enable improved error injection and status reporting via the introduction of new memory mapped access to syndrome and data signals.
HPS to FPGA Interconnect Backbone	Although the HPS and the Logic Core can operate independently, they are tightly coupled via a high-bandwidth system interconnect built from high-performance ARM AMBA AXI bus bridges. IP bus masters in the FPGA fabric have access to HPS bus slaves via the FPGA-to-HPS interconnect. Similarly, HPS bus masters have access to bus slaves in the core fabric via the HPS-to-FPGA bridge. Both bridges are AMBA AXI-3 compliant and support simultaneous read and write transactions. Up to three masters within the core fabric can share the HPS SDRAM controller with the processor. Additionally, the processor can be used to configure the core fabric under program control via a dedicated 32-bit configuration port.
FPGA configuration and HPS booting	The FPGA fabric and HPS in the SoCs are powered independently. You can reduce the clock frequencies or gate the clocks to reduce dynamic power. You can configure the FPGA fabric and boot the HPS independently, in any order, providing you with more design flexibility.
Security	New security features have been introduced for anti-tamper management, secure boot, encryption (AES), and authentication (SHA).

Instead of placing all device functions in the FPGA fabric, you can store some functions that do not run simultaneously in external memory and load them only when required. This capability increases the effective logic density of the device, and lowers cost and power consumption.

In the Intel solution, you do not have to worry about intricate device architecture to perform a partial reconfiguration. The partial reconfiguration capability is built into the Intel Quartus Prime design software, making such time-intensive task simple.

Intel Arria 10 devices support partial reconfiguration in the following configuration options:

- Using an internal host:
  - All supported configuration modes where the FPGA has access to external memory devices such as serial and parallel flash memory.
  - Configuration via Protocol [CvP (PCIe)]
- Using an external host—passive serial (PS), fast passive parallel (FPP) x8, FPP x16, and FPP x32 I/O interface.

## Enhanced Configuration and Configuration via Protocol

**Table 25. Configuration Schemes and Features of Intel Arria 10 Devices**

Intel Arria 10 devices support 1.8 V programming voltage and several configuration schemes.

Scheme	Data Width	Max Clock Rate (MHz)	Max Data Rate (Mbps) <sup>(13)</sup>	Decompression	Design Security <sup>(14)</sup>	Partial Reconfiguration <sup>(15)</sup>	Remote System Update
JTAG	1 bit	33	33	—	—	Yes <sup>(16)</sup>	—
Active Serial (AS) through the EPCQ-L configuration device	1 bit, 4 bits	100	400	Yes	Yes	Yes <sup>(16)</sup>	Yes
Passive serial (PS) through CPLD or external microcontroller	1 bit	100	100	Yes	Yes	Yes <sup>(16)</sup>	Parallel Flash Loader (PFL) IP core

*continued...*

<sup>(13)</sup> Enabling either compression or design security features affects the maximum data rate. Refer to the Intel Arria 10 Device Datasheet for more information.

<sup>(14)</sup> Encryption and compression cannot be used simultaneously.

<sup>(15)</sup> Partial reconfiguration is an advanced feature of the device family. If you are interested in using partial reconfiguration, contact Intel for support.

<sup>(16)</sup> Partial configuration can be performed only when it is configured as internal host.

Scheme	Data Width	Max Clock Rate (MHz)	Max Data Rate (Mbps) <sup>(13)</sup>	Decompression	Design Security <sup>(14)</sup>	Partial Reconfiguration <sup>(15)</sup>	Remote System Update
Fast passive parallel (FPP) through CPLD or external microcontroller	8 bits	100	3200	Yes	Yes	Yes <sup>(17)</sup>	PFL IP core
	16 bits			Yes	Yes		
	32 bits			Yes	Yes		
Configuration via HPS	16 bits	100	3200	Yes	Yes	Yes <sup>(17)</sup>	—
	32 bits			Yes	Yes		
Configuration via Protocol [CvP (PCIe*)]	x1, x2, x4, x8 lanes	—	8000	Yes	Yes	Yes <sup>(16)</sup>	—

You can configure Intel Arria 10 devices through PCIe using Configuration via Protocol (CvP). The Intel Arria 10 CvP implementation conforms to the PCIe 100 ms power-up-to-active time requirement.

## SEU Error Detection and Correction

Intel Arria 10 devices offer robust and easy-to-use single-event upset (SEU) error detection and correction circuitry.

The detection and correction circuitry includes protection for Configuration RAM (CRAM) programming bits and user memories. The CRAM is protected by a continuously running CRC error detection circuit with integrated ECC that automatically corrects one or two errors and detects higher order multi-bit errors. When more than two errors occur, correction is available through reloading of the core programming file, providing a complete design refresh while the FPGA continues to operate.

The physical layout of the Intel Arria 10 CRAM array is optimized to make the majority of multi-bit upsets appear as independent single-bit or double-bit errors which are automatically corrected by the integrated CRAM ECC circuitry. In addition to the CRAM protection, the M20K memory blocks also include integrated ECC circuitry and are layout-optimized for error detection and correction. The MLAB does not have ECC.

## Power Management

Intel Arria 10 devices leverage the advanced 20 nm process technology, a low 0.9 V core power supply, an enhanced core architecture, and several optional power reduction techniques to reduce total power consumption by as much as 40% compared to Arria V devices and as much as 60% compared to Stratix V devices.

<sup>(13)</sup> Enabling either compression or design security features affects the maximum data rate. Refer to the Intel Arria 10 Device Datasheet for more information.

<sup>(14)</sup> Encryption and compression cannot be used simultaneously.

<sup>(15)</sup> Partial reconfiguration is an advanced feature of the device family. If you are interested in using partial reconfiguration, contact Intel for support.

<sup>(17)</sup> Supported at a maximum clock rate of 100 MHz.

Date	Version	Changes
		<ul style="list-style-type: none"> <li>Removed package code 40, low static power, SmartVID, industrial, and military operating temperature support from <i>Sample Ordering Core and Available Options for Intel Arria 10 GT Devices</i> figure.</li> <li>Updated short reach transceiver rate for Intel Arria 10 GT devices to 25.8 Gbps.</li> <li>Removed On-Die Instrumentation — EyeQ and Jitter Margin Tool support from <i>PMA Features of the Transceivers in Intel Arria 10 Devices</i> table.</li> </ul>
September 2017	2017.09.20	Updated the maximum speed of the DDR4 external memory interface from 1,333 MHz/2,666 Mbps to 1,200 MHz/2,400 Mbps.
July 2017	2017.07.13	Corrected the automotive temperature range in the figure showing the available options for the Intel Arria 10 GX devices from "-40°C to 100°C" to "-40°C to 125°C".
July 2017	2017.07.06	Added automotive temperature option to Intel Arria 10 GX device family.
May 2017	2017.05.08	<ul style="list-style-type: none"> <li>Corrected protocol names with "1588" to "IEEE 1588v2".</li> <li>Updated the vertical migration table to remove vertical migration between Intel Arria 10 GX and Intel Arria 10 SX device variants.</li> <li>Removed all "Preliminary" marks.</li> </ul>
March 2017	2017.03.15	<ul style="list-style-type: none"> <li>Removed the topic about migration from Intel Arria 10 to Intel Stratix 10 devices.</li> <li>Rebranded as Intel.</li> </ul>
October 2016	2016.10.31	<ul style="list-style-type: none"> <li>Removed package F36 from Intel Arria 10 GX devices.</li> <li>Updated Intel Arria 10 GT sample ordering code and maximum GX transceiver count. Intel Arria 10 GT devices are available only in the SF45 package option with a maximum of 72 transceivers.</li> </ul>
May 2016	2016.05.02	<ul style="list-style-type: none"> <li>Updated the FPGA Configuration and HPS Booting topic.</li> <li>Remove V<sub>CC</sub> PowerManager from the Summary of Features, Power Management and Arria 10 Device Variants and packages topics. This feature is no longer supported in Arria 10 devices.</li> <li>Removed LPDDR3 from the Memory Standards Supported by the HPS Hard Memory Controller table in the Memory Standards Supported by Intel Arria 10 Devices topic. This standard is only supported by the FPGA.</li> <li>Removed transceiver speed grade 5 from the Device Variants and Packages topic for Arria 10 GX and SX devices.</li> </ul>
February 2016	2016.02.11	<ul style="list-style-type: none"> <li>Changed the maximum Arria 10 GT datarate to 25.8 Gbps and the minimum datarate to 1 Gbps globally.</li> <li>Revised the state for Core clock networks in the Summary of Features topic.</li> <li>Changed the transceiver parameters in the "Summary of Features for Arria 10 Devices" table.</li> <li>Changed the transceiver parameters in the "Maximum Resource Counts for Arria 10 GT Devices" table.</li> <li>Changed the package availability for GT devices in the "Package Plan for Arria 10 GT Devices" table.</li> <li>Changed the package configurations for GT devices in the "Migration Capability Across Arria 10 Product Lines" figure.</li> <li>Changed transceiver parameters in the "Low Power Serial Transceivers" section.</li> <li>Changed the transceiver descriptions in the "Device Variants for the Arria 10 Device Family" table.</li> <li>Changed the "Sample Ordering Code and Available Options for Arria 10 GT Devices" figure.</li> <li>Changed the datarates for GT devices in the "PMA Features" section.</li> <li>Changed the datarates for GT devices in the "PCS Features" section.</li> </ul>
