# Understanding <u>Embedded - FPGAs (Field Programmable Gate Array)</u>

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

## **Applications of Embedded - FPGAs**

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Active
Number of LABs/CLBs	250540
Number of Logic Elements/Cells	660000
Total RAM Bits	49610752
Number of I/O	492
Number of Gates	-
Voltage - Supply	0.87V ~ 0.93V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	1152-BBGA, FCBGA
Supplier Device Package	1152-FCBGA (35x35)

Address: Room A, 16/F, Full Win Commercial Centre, 573 Nathan Road, Mongkok, Hong Kong

# Intel® Arria® 10 Device Overview

The Intel® Arria® 10 device family consists of high-performance and power-efficient 20 nm mid-range FPGAs and SoCs.

Intel Arria 10 device family delivers:

- Higher performance than the previous generation of mid-range and high-end FPGAs.
- Power efficiency attained through a comprehensive set of power-saving technologies.

The Intel Arria 10 devices are ideal for high performance, power-sensitive, midrange applications in diverse markets.

Table 1. Sample Markets and Ideal Applications for Intel Arria 10 Devices

Market	Applications
Wireless	Channel and switch cards in remote radio heads     Mobile backhaul
Wireline	<ul> <li>40G/100G muxponders and transponders</li> <li>100G line cards</li> <li>Bridging</li> <li>Aggregation</li> </ul>
Broadcast	<ul> <li>Studio switches</li> <li>Servers and transport</li> <li>Videoconferencing</li> <li>Professional audio and video</li> </ul>
Computing and Storage	Flash cache     Cloud computing servers     Server acceleration
Medical	Diagnostic scanners     Diagnostic imaging
Military	Missile guidance and control     Radar     Electronic warfare     Secure communications

 $<sup>^{(8)}</sup>$  The number of GPIOs does not include transceiver I/Os. In the Intel Quartus Prime software, the number of user I/Os includes transceiver I/Os.

<sup>(9)</sup> Each LVDS I/O pair can be used as differential input or output.

Figure 5. ALM for Intel Arria 10 Devices

The Intel Quartus Prime software optimizes your design according to the ALM logic structure and automatically maps legacy designs into the Intel Arria 10 ALM architecture.

## **Variable-Precision DSP Block**

The Intel Arria 10 variable precision DSP blocks support fixed-point arithmetic and floating-point arithmetic.

Features for fixed-point arithmetic:

- · High-performance, power-optimized, and fully registered multiplication operations
- 18-bit and 27-bit word lengths
- Two 18 x 19 multipliers or one 27 x 27 multiplier per DSP block
- Built-in addition, subtraction, and 64-bit double accumulation register to combine multiplication results
- Cascading 19-bit or 27-bit when pre-adder is disabled and cascading 18-bit when pre-adder is used to form the tap-delay line for filtering applications
- Cascading 64-bit output bus to propagate output results from one block to the next block without external logic support
- Hard pre-adder supported in 19-bit and 27-bit modes for symmetric filters
- Internal coefficient register bank in both 18-bit and 27-bit modes for filter implementation
- 18-bit and 27-bit systolic finite impulse response (FIR) filters with distributed output adder
- Biased rounding support

## **Embedded Memory Configurations for Single-port Mode**

## Table 19. Single-port Embedded Memory Configurations for Intel Arria 10 Devices

This table lists the maximum configurations supported for single-port RAM and ROM modes.

Memory Block	Depth (bits)	Programmable Width
MLAB	32	x16, x18, or x20
	64 (10)	x8, x9, x10
M20K	512	x40, x32
	1K	x20, x16
	2K	x10, x8
	4K	x5, x4
	8K	x2
	16K	x1

#### **Clock Networks and PLL Clock Sources**

The clock network architecture is based on Intel's global, regional, and peripheral clock structure. This clock structure is supported by dedicated clock input pins, fractional clock synthesis PLLs, and integer I/O PLLs.

#### **Clock Networks**

The Intel Arria 10 core clock networks are capable of up to 800 MHz fabric operation across the full industrial temperature range. For the external memory interface, the clock network supports the hard memory controller with speeds up to 2,400 Mbps in a quarter-rate transfer.

To reduce power consumption, the Intel Quartus Prime software identifies all unused sections of the clock network and powers them down.

## Fractional Synthesis and I/O PLLs

Intel Arria 10 devices contain up to 32 fractional synthesis PLLs and up to 16 I/O PLLs that are available for both specific and general purpose uses in the core:

- Fractional synthesis PLLs—located in the column adjacent to the transceiver blocks
- I/O PLLs-located in each bank of the 48 I/Os

## **Fractional Synthesis PLLs**

You can use the fractional synthesis PLLs to:

- Reduce the number of oscillators that are required on your board
- Reduce the number of clock pins that are used in the device by synthesizing multiple clock frequencies from a single reference clock source

<sup>(10)</sup> Supported through software emulation and consumes additional MLAB blocks.

#### A10-OVERVIEW | 2018.04.09

The fractional synthesis PLLs support the following features:

- Reference clock frequency synthesis for transceiver CMU and Advanced Transmit (ATX) PLLs
- Clock network delay compensation
- Zero-delay buffering
- Direct transmit clocking for transceivers
- Independently configurable into two modes:
  - Conventional integer mode equivalent to the general purpose PLL
  - Enhanced fractional mode with third order delta-sigma modulation
- PLL cascading

### I/O PLLs

The integer mode I/O PLLs are located in each bank of 48 I/Os. You can use the I/O PLLs to simplify the design of external memory and high-speed LVDS interfaces.

In each I/O bank, the I/O PLLs are adjacent to the hard memory controllers and LVDS SERDES. Because these PLLs are tightly coupled with the I/Os that need to use them, it makes it easier to close timing.

You can use the I/O PLLs for general purpose applications in the core such as clock network delay compensation and zero-delay buffering.

Intel Arria 10 devices support PLL-to-PLL cascading.

# FPGA General Purpose I/O

Intel Arria 10 devices offer highly configurable GPIOs. Each I/O bank contains 48 general purpose I/Os and a high-efficiency hard memory controller.

The following list describes the features of the GPIOs:

- Consist of 3 V I/Os for high-voltage application and LVDS I/Os for differential signaling
  - $-\$  Up to two 3 V I/O banks, available in some devices, that support up to 3 V I/O standards
  - LVDS I/O banks that support up to 1.8 V I/O standards
- Support a wide range of single-ended and differential I/O interfaces
- LVDS speeds up to 1.6 Gbps
- Each LVDS pair of pins has differential input and output buffers, allowing you to configure the LVDS direction for each pair.
- Programmable bus hold and weak pull-up
- Programmable differential output voltage (V<sub>OD</sub>) and programmable pre-emphasis

#### A10-OVERVIEW | 2018.04.09

The scalable hard IP supports multiple independent 10GbE ports while using a single PLL for all the 10GBASE-R PCS instantiations, which saves on core logic resources and clock networks:

- Simplifies multiport 10GbE systems compared to XAUI interfaces that require an external XAUI-to-10G PHY.
- Incorporates Electronic Dispersion Compensation (EDC), which enables direct connection to standard 10 Gbps XFP and SFP+ pluggable optical modules.
- Supports backplane Ethernet applications and includes a hard 10GBASE-KR Forward Error Correction (FEC) circuit that you can use for 10 Gbps and 40 Gbps applications.

The 10 Gbps Ethernet PCS hard IP and 10GBASE-KR FEC are present in every transceiver channel.

#### **Related Information**

PCS Features on page 30

### **Low Power Serial Transceivers**

Intel Arria 10 FPGAs and SoCs include lowest power transceivers that deliver high bandwidth, throughput and low latency.

Intel Arria 10 devices deliver the industry's lowest power consumption per transceiver channel:

- 12.5 Gbps transceivers at as low as 242 mW
- 10 Gbps transceivers at as low as 168 mW
- 6 Gbps transceivers at as low as 117 mW

Intel Arria 10 transceivers support various data rates according to application:

- Chip-to-chip and chip-to-module applications—from 1 Gbps up to 25.8 Gbps
- Long reach and backplane applications—from 1 Gbps up to 12.5 with advanced adaptive equalization
- Critical power sensitive applications—from 1 Gbps up to 11.3 Gbps using lower power modes

The combination of 20 nm process technology and architectural advances provide the following benefits:

- Significant reduction in die area and power consumption
- Increase of up to two times in transceiver I/O density compared to previous generation devices while maintaining optimal signal integrity
- Up to 72 total transceiver channels—you can configure up to 6 of these channels to run as fast as 25.8 Gbps
- All channels feature continuous data rate support up to the maximum rated speed

### **Transceiver Channels**

All transceiver channels feature a dedicated Physical Medium Attachment (PMA) and a hardened Physical Coding Sublayer (PCS).

- The PMA provides primary interfacing capabilities to physical channels.
- The PCS typically handles encoding/decoding, word alignment, and other preprocessing functions before transferring data to the FPGA core fabric.

A transceiver channel consists of a PMA and a PCS block. Most transceiver banks have 6 channels. There are some transceiver banks that contain only 3 channels.

A wide variety of bonded and non-bonded data rate configurations is possible using a highly configurable clock distribution network. Up to 80 independent transceiver data rates can be configured.

The following figures are graphical representations of top views of the silicon die, which correspond to reverse views for flip chip packages. Different Intel Arria 10 devices may have different floorplans than the ones shown in the figures.

Figure 7. Device Chip Overview for Intel Arria 10 GX and GT Devices

Figure 8. Device Chip Overview for Intel Arria 10 SX Devices

#### **PMA Features**

Intel Arria 10 transceivers provide exceptional signal integrity at data rates up to 25.8 Gbps. Clocking options include ultra-low jitter ATX PLLs (LC tank based), clock multiplier unit (CMU) PLLs, and fractional PLLs.

Each transceiver channel contains a channel PLL that can be used as the CMU PLL or clock data recovery (CDR) PLL. In CDR mode, the channel PLL recovers the receiver clock and data in the transceiver channel. Up to 80 independent data rates can be configured on a single Intel Arria 10 device.

Table 23. PMA Features of the Transceivers in Intel Arria 10 Devices

Feature	Capability
Chip-to-Chip Data Rates	1 Gbps to 17.4 Gbps (Intel Arria 10 GX devices) 1 Gbps to 25.8 Gbps (Intel Arria 10 GT devices)
Backplane Support	Drive backplanes at data rates up to 12.5 Gbps
Optical Module Support	SFP+/SFP, XFP, CXP, QSFP/QSFP28, CFP/CFP2/CFP4
Cable Driving Support	SFP+ Direct Attach, PCI Express over cable, eSATA
Transmit Pre-Emphasis	4-tap transmit pre-emphasis and de-emphasis to compensate for system channel loss
Continuous Time Linear Equalizer (CTLE)	Dual mode, high-gain, and high-data rate, linear receive equalization to compensate for system channel loss
Decision Feedback Equalizer (DFE)	7-fixed and 4-floating tap DFE to equalize backplane channel loss in the presence of crosstalk and noisy environments
Variable Gain Amplifier	Optimizes the signal amplitude prior to the CDR sampling and operates in fixed and adaptive modes
Altera Digital Adaptive Parametric Tuning (ADAPT)	Fully digital adaptation engine to automatically adjust all link equalization parameters—including CTLE, DFE, and variable gain amplifier blocks—that provide optimal link margin without intervention from user logic
Precision Signal Integrity Calibration Engine (PreSICE)	Hardened calibration controller to quickly calibrate all transceiver control parameters on power-up, which provides the optimal signal integrity and jitter performance
Advanced Transmit (ATX) PLL	Low jitter ATX (LC tank based) PLLs with continuous tuning range to cover a wide range of standard and proprietary protocols
Fractional PLLs	On-chip fractional frequency synthesizers to replace on-board crystal oscillators and reduce system cost
Digitally Assisted Analog CDR	Superior jitter tolerance with fast lock time
Dynamic Partial Reconfiguration	Allows independent control of the Avalon memory-mapped interface of each transceiver channel for the highest transceiver flexibility
Multiple PCS-PMA and PCS- PLD interface widths	8-, 10-, 16-, 20-, 32-, 40-, or 64-bit interface widths for flexibility of deserialization width, encoding, and reduced latency

## **PCS Features**

This table summarizes the Intel Arria 10 transceiver PCS features. You can use the transceiver PCS to support a wide range of protocols ranging from 1 Gbps to 25.8 Gbps.

PCS	Description
Standard PCS	<ul> <li>Operates at a data rate up to 12 Gbps</li> <li>Supports protocols such as PCI-Express, CPRI 4.2+, GigE, IEEE 1588 in Hard PCS</li> <li>Implements other protocols using Basic/Custom (Standard PCS) transceiver configuration rules.</li> </ul>
Enhanced PCS	<ul> <li>Performs functions common to most serial data industry standards, such as word alignment, encoding/decoding, and framing, before data is sent or received off-chip through the PMA</li> <li>Handles data transfer to and from the FPGA fabric</li> <li>Handles data transfer internally to and from the PMA</li> <li>Provides frequency compensation</li> <li>Performs channel bonding for multi-channel low skew applications</li> </ul>
PCIe Gen3 PCS	<ul> <li>Supports the seamless switching of Data and Clock between the Gen1, Gen2, and Gen3 data rates</li> <li>Provides support for PIPE 3.0 features</li> <li>Supports the PIPE interface with the Hard IP enabled, as well as with the Hard IP bypassed</li> </ul>

- 10 Gbps Ethernet Support on page 26

## **PCS Protocol Support**

This table lists some of the protocols supported by the Intel Arria 10 transceiver PCS. For more information about the blocks in the transmitter and receiver data paths, refer to the related information.

Protocol	Data Rate (Gbps)	Transceiver IP	PCS Support	
PCIe Gen3 x1, x2, x4, x8	8.0	Native PHY (PIPE)	Standard PCS and PCIe Gen3 PCS	
PCIe Gen2 x1, x2, x4, x8	5.0	Native PHY (PIPE)	Standard PCS	
PCIe Gen1 x1, x2, x4, x8	2.5	Native PHY (PIPE)	Standard PCS	
1000BASE-X Gigabit Ethernet	1.25	Native PHY	Standard PCS	
1000BASE-X Gigabit Ethernet with IEEE 1588v2	1.25	Native PHY	Standard PCS	
10GBASE-R	10.3125 Native PHY		Enhanced PCS	
10GBASE-R with IEEE 1588v2	10.3125	Native PHY	Enhanced PCS	
10GBASE-R with KR FEC	10.3125	Native PHY	Enhanced PCS	
10GBASE-KR and 1000BASE-X	10.3125	1G/10GbE and 10GBASE-KR PHY	Standard PCS and Enhanced PCS	
Interlaken (CEI-6G/11G)	3.125 to 17.4	Native PHY	Enhanced PCS	
SFI-S/SFI-5.2	11.2	Native PHY	Enhanced PCS	
10G SDI	10.692	Native PHY	Enhanced PCS	
	•		continued	

Protocol	Data Rate (Gbps)	Transceiver IP	PCS Support
CPRI 6.0 (64B/66B)	0.6144 to 10.1376	Native PHY	Enhanced PCS
CPRI 4.2 (8B/10B)	0.6144 to 9.8304	Native PHY	Standard PCS
OBSAI RP3 v4.2	0.6144 to 6.144	Native PHY	Standard PCS
SD-SDI/HD-SDI/3G-SDI	0.143 <sup>(12)</sup> to 2.97	Native PHY	Standard PCS

#### **Related Information**

#### Intel Arria 10 Transceiver PHY User Guide

Provides more information about the supported transceiver protocols and PHY IP, the PMA architecture, and the standard, enhanced, and PCIe Gen3 PCS architecture.

# **SoC with Hard Processor System**

Each SoC device combines an FPGA fabric and a hard processor system (HPS) in a single device. This combination delivers the flexibility of programmable logic with the power and cost savings of hard IP in these ways:

- Reduces board space, system power, and bill of materials cost by eliminating a discrete embedded processor
- Allows you to differentiate the end product in both hardware and software, and to support virtually any interface standard
- Extends the product life and revenue through in-field hardware and software updates

<sup>(12)</sup> The 0.143 Gbps data rate is supported using oversampling of user logic that you must implement in the FPGA fabric.

Figure 9. HPS Block Diagram

This figure shows a block diagram of the HPS with the dual ARM Cortex-A9 MPCore processor.

# **Key Advantages of 20-nm HPS**

The 20-nm HPS strikes a balance between enabling maximum software compatibility with 28-nm SoCs while still improving upon the 28-nm HPS architecture. These improvements address the requirements of the next generation target markets such as wireless and wireline communications, compute and storage equipment, broadcast and military in terms of performance, memory bandwidth, connectivity via backplane and security.

#### **System Peripherals and Debug Access Port**

Each Ethernet MAC, USB OTG, NAND flash controller, and SD/MMC controller module has an integrated DMA controller. For modules without an integrated DMA controller, an additional DMA controller module provides up to eight channels of high-bandwidth data transfers. Peripherals that communicate off-chip are multiplexed with other peripherals at the HPS pin level. This allows you to choose which peripherals interface with other devices on your PCB.

The debug access port provides interfaces to industry standard JTAG debug probes and supports ARM CoreSight debug and core traces to facilitate software development.

## **HPS-FPGA AXI Bridges**

The HPS-FPGA bridges, which support the Advanced Microcontroller Bus Architecture (AMBA) Advanced eXtensible Interface (AXI $^{\text{\tiny M}}$ ) specifications, consist of the following bridges:

- FPGA-to-HPS AMBA AXI bridge—a high-performance bus supporting 32, 64, and 128 bit data widths that allows the FPGA fabric to issue transactions to slaves in the HPS.
- HPS-to-FPGA Avalon/AMBA AXI bridge—a high-performance bus supporting 32, 64, and 128 bit data widths that allows the HPS to issue transactions to slaves in the FPGA fabric.
- Lightweight HPS-to-FPGA AXI bridge—a lower latency 32 bit width bus that allows
  the HPS to issue transactions to soft peripherals in the FPGA fabric. This bridge is
  primarily used for control and status register (CSR) accesses to peripherals in the
  FPGA fabric.

The HPS-FPGA AXI bridges allow masters in the FPGA fabric to communicate with slaves in the HPS logic, and vice versa. For example, the HPS-to-FPGA AXI bridge allows you to share memories instantiated in the FPGA fabric with one or both microprocessors in the HPS, while the FPGA-to-HPS AXI bridge allows logic in the FPGA fabric to access the memory and peripherals in the HPS.

Each HPS-FPGA bridge also provides asynchronous clock crossing for data transferred between the FPGA fabric and the HPS.

## **HPS SDRAM Controller Subsystem**

The HPS SDRAM controller subsystem contains a multiport SDRAM controller and DDR PHY that are shared between the FPGA fabric (through the FPGA-to-HPS SDRAM interface), the level 2 (L2) cache, and the level 3 (L3) system interconnect. The FPGA-to-HPS SDRAM interface supports AMBA AXI and Avalon® Memory-Mapped (Avalon-MM) interface standards, and provides up to six individual ports for access by masters implemented in the FPGA fabric.

The HPS SDRAM controller supports up to 3 masters (command ports), 3x 64-bit read data ports and 3x 64-bit write data ports.

To maximize memory performance, the SDRAM controller subsystem supports command and data reordering, deficit round-robin arbitration with aging, and high-priority bypass features.

## **FPGA Configuration and HPS Booting**

The FPGA fabric and HPS in the SoC FPGA must be powered at the same time. You can reduce the clock frequencies or gate the clocks to reduce dynamic power.

Once powered, the FPGA fabric and HPS can be configured independently thus providing you with more design flexibility:

- You can boot the HPS independently. After the HPS is running, the HPS can fully or
  partially reconfigure the FPGA fabric at any time under software control. The HPS
  can also configure other FPGAs on the board through the FPGA configuration
  controller.
- Configure the FPGA fabric first, and then boot the HPS from memory accessible to the FPGA fabric.

## **Hardware and Software Development**

For hardware development, you can configure the HPS and connect your soft logic in the FPGA fabric to the HPS interfaces using the Platform Designer system integration tool in the Intel Quartus Prime software.

For software development, the ARM-based SoC FPGA devices inherit the rich software development ecosystem available for the ARM Cortex-A9 MPCore processor. The software development process for Intel SoC FPGAs follows the same steps as those for other SoC devices from other manufacturers. Support for Linux\*, VxWorks\*, and other operating systems are available for the SoC FPGAs. For more information on the operating systems support availability, contact the Intel FPGA sales team.

You can begin device-specific firmware and software development on the Intel SoC FPGA Virtual Target. The Virtual Target is a fast PC-based functional simulation of a target development system—a model of a complete development board. The Virtual Target enables the development of device-specific production software that can run unmodified on actual hardware.

# **Dynamic and Partial Reconfiguration**

The Intel Arria 10 devices support dynamic and partial reconfiguration. You can use dynamic and partial reconfiguration simultaneously to enable seamless reconfiguration of both the device core and transceivers.

## **Dynamic Reconfiguration**

You can reconfigure the PMA and PCS blocks while the device continues to operate. This feature allows you to change the data rates, protocol, and analog settings of a channel in a transceiver bank without affecting on-going data transfer in other transceiver banks. This feature is ideal for applications that require dynamic multiprotocol or multirate support.

## **Partial Reconfiguration**

Using partial reconfiguration, you can reconfigure some parts of the device while keeping the device in operation.

Scheme	Data Width	Max Clock Rate (MHz)	Max Data Rate (Mbps)	Decompression	Design Security <sup>(1</sup> 4)	Partial Reconfiguration (15)	Remote System Update
Fast passive	8 bits	100	3200	Yes	Yes	Yes <sup>(17)</sup>	PFL IP
parallel (FPP) through CPLD or	16 bits			Yes	Yes		core
external microcontroller	32 bits			Yes	Yes		
Configuration via	16 bits	100	3200	Yes	Yes	Yes <sup>(17)</sup>	_
HPS	32 bits			Yes	Yes		
Configuration via Protocol [CvP (PCIe*)]	x1, x2, x4, x8 lanes	_	8000	Yes	Yes	Yes <sup>(16)</sup>	_

You can configure Intel Arria 10 devices through PCIe using Configuration via Protocol (CvP). The Intel Arria 10 CvP implementation conforms to the PCIe 100 ms power-up-to-active time requirement.

#### **SEU Error Detection and Correction**

Intel Arria 10 devices offer robust and easy-to-use single-event upset (SEU) error detection and correction circuitry.

The detection and correction circuitry includes protection for Configuration RAM (CRAM) programming bits and user memories. The CRAM is protected by a continuously running CRC error detection circuit with integrated ECC that automatically corrects one or two errors and detects higher order multi-bit errors. When more than two errors occur, correction is available through reloading of the core programming file, providing a complete design refresh while the FPGA continues to operate.

The physical layout of the Intel Arria 10 CRAM array is optimized to make the majority of multi-bit upsets appear as independent single-bit or double-bit errors which are automatically corrected by the integrated CRAM ECC circuitry. In addition to the CRAM protection, the M20K memory blocks also include integrated ECC circuitry and are layout-optimized for error detection and correction. The MLAB does not have ECC.

# **Power Management**

Intel Arria 10 devices leverage the advanced 20 nm process technology, a low 0.9 V core power supply, an enhanced core architecture, and several optional power reduction techniques to reduce total power consumption by as much as 40% compared to Arria V devices and as much as 60% compared to Stratix V devices.

<sup>(13)</sup> Enabling either compression or design security features affects the maximum data rate. Refer to the Intel Arria 10 Device Datasheet for more information.

<sup>(14)</sup> Encryption and compression cannot be used simultaneously.

<sup>(15)</sup> Partial reconfiguration is an advanced feature of the device family. If you are interested in using partial reconfiguration, contact Intel for support.

<sup>(17)</sup> Supported at a maximum clock rate of 100 MHz.

The optional power reduction techniques in Intel Arria 10 devices include:

- SmartVID—a code is programmed into each device during manufacturing that allows a smart regulator to operate the device at lower core V<sub>CC</sub> while maintaining performance
- **Programmable Power Technology**—non-critical timing paths are identified by the Intel Quartus Prime software and the logic in these paths is biased for low power instead of high performance
- **Low Static Power Options**—devices are available with either standard static power or low static power while maintaining performance

Furthermore, Intel Arria 10 devices feature Intel's industry-leading low power transceivers and include a number of hard IP blocks that not only reduce logic resources but also deliver substantial power savings compared to soft implementations. In general, hard IP blocks consume up to 90% less power than the equivalent soft logic implementations.

# **Incremental Compilation**

The Intel Quartus Prime software incremental compilation feature reduces compilation time and helps preserve performance to ease timing closure. The incremental compilation feature enables the partial reconfiguration flow for Intel Arria 10 devices.

Incremental compilation supports top-down, bottom-up, and team-based design flows. This feature facilitates modular, hierarchical, and team-based design flows where different designers compile their respective design sections in parallel. Furthermore, different designers or IP providers can develop and optimize different blocks of the design independently. These blocks can then be imported into the top level project.

# **Document Revision History for Intel Arria 10 Device Overview**

Document Version	Changes
2018.04.09	Updated the lowest $V_{CC}$ from 0.83 V to 0.82 V in the topic listing a summary of the device features.

Date	Version	Changes
January 2018	2018.01.17	Updated the maximum data rate for HPS (Intel Arria 10 SX devices external memory interface DDR3 controller from 2,166 Mbps to 2,133 Mbps.
		Updated maximum frequency supported for half rate QDRII and QDRII     + SRAM to 633 MHz in Memory Standards Supported by the Soft     Memory Controller table.
		Updated transceiver backplane capability to 12.5 Gbps.
		Removed transceiver speed grade 5 in Sample Ordering Core and Available Options for Intel Arria 10 GX Devices figure.
	·	continued

#### A10-OVERVIEW | 2018.04.09

September 2017  July 2017  July 2017  May 2017	2017.09.20 2017.07.13	<ul> <li>Removed package code 40, low static power, SmartVID, industrial, and military operating temperature support from Sample Ordering Core and Available Options for Intel Arria 10 GT Devices figure.</li> <li>Updated short reach transceiver rate for Intel Arria 10 GT devices to 25.8 Gbps.</li> <li>Removed On-Die Instrumentation — EyeQ and Jitter Margin Tool support from PMA Features of the Transceivers in Intel Arria 10 Devices table.</li> <li>Updated the maximum speed of the DDR4 external memory interface from 1,333 MHz/2,666 Mbps to 1,200 MHz/2,400 Mbps.</li> </ul>
July 2017 July 2017		1,333 MHz/2,666 Mbps to 1,200 MHz/2,400 Mbps.
July 2017	2017.07.13	
•	1	Corrected the automotive temperature range in the figure showing the available options for the Intel Arria 10 GX devices from "-40°C to 100°C" to "-40°C to 125°C".
May 2017	2017.07.06	Added automotive temperature option to Intel Arria 10 GX device family.
	2017.05.08	<ul> <li>Corrected protocol names with "1588" to "IEEE 1588v2".</li> <li>Updated the vertical migration table to remove vertical migration between Intel Arria 10 GX and Intel Arria 10 SX device variants.</li> <li>Removed all "Preliminary" marks.</li> </ul>
March 2017	2017.03.15	<ul> <li>Removed the topic about migration from Intel Arria 10 to Intel Stratix 10 devices.</li> <li>Rebranded as Intel.</li> </ul>
October 2016	2016.10.31	<ul> <li>Removed package F36 from Intel Arria 10 GX devices.</li> <li>Updated Intel Arria 10 GT sample ordering code and maximum GX transceiver count. Intel Arria 10 GT devices are available only in the SF45 package option with a maximum of 72 transceivers.</li> </ul>
May 2016	2016.05.02	<ul> <li>Updated the FPGA Configuration and HPS Booting topic.</li> <li>Remove V<sub>CC</sub> PowerManager from the Summary of Features, Power Management and Arria 10 Device Variants and packages topics. This feature is no longer supported in Arria 10 devices.</li> <li>Removed LPDDR3 from the Memory Standards Supported by the HPS Hard Memory Controller table in the Memory Standards Supported by Intel Arria 10 Devices topic. This standard is only supported by the FPGA.</li> <li>Removed transceiver speed grade 5 from the Device Variants and Packages topic for Arria 10 GX and SX devices.</li> </ul>
February 2016	2016.02.11	<ul> <li>Changed the maximum Arria 10 GT datarate to 25.8 Gbps and the minimum datarate to 1 Gbps globally.</li> <li>Revised the state for Core clock networks in the Summary of Features topic.</li> <li>Changed the transceiver parameters in the "Summary of Features for Arria 10 Devices" table.</li> <li>Changed the transceiver parameters in the "Maximum Resource Counts for Arria 10 GT Devices" table.</li> <li>Changed the package availability for GT devices in the "Package Plan for Arria 10 GT Devices" table.</li> <li>Changed the package configurations for GT devices in the "Migration Capability Across Arria 10 Product Lines" figure.</li> <li>Changed transceiver parameters in the "Low Power Serial Transceivers" section.</li> <li>Changed the transceiver descriptions in the "Device Variants for the Arria 10 Device Family" table.</li> <li>Changed the "Sample Ordering Code and Available Options for Arria 10 GT Devices" figure.</li> <li>Changed the datarates for GT devices in the "PMA Features" section.</li> <li>Changed the datarates for GT devices in the "PCS Features" section.</li> </ul>
