Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Active
Number of LABs/CLBs	339620
Number of Logic Elements/Cells	900000
Total RAM Bits	59234304
Number of I/O	600
Number of Gates	-
Voltage - Supply	0.87V ~ 0.98V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	1517-BBGA, FCBGA
Supplier Device Package	1517-FCBGA (40x40)

Key Advantages of Intel Arria 10 Devices

Table 2. Key Advantages of the Intel Arria 10 Device Family

Advantage	Supporting Feature
Enhanced core architecture	• Built on TSMC's 20 nm process technology • 60% higher performance than the previous generation of mid-range FPGAs • 15% higher performance than the fastest previous-generation FPGA
High-bandwidth integrated transceivers	• Short-reach rates up to 25.8 Gigabits per second (Gbps) • Backplane capability up to 12.5 Gbps • Integrated 10GBASE-KR and 40GBASE-KR4 Forward Error Correction (FEC)
Improved logic integration and hard IP blocks	• 8-input adaptive logic module (ALM) • Up to 65.6 megabits (Mb) of embedded memory • Variable-precision digital signal processing (DSP) blocks • Fractional synthesis phase-locked loops (PLLs) • Hard PCI Express Gen3 IP blocks • Hard memory controllers and PHY up to 2,400 Megabits per second (Mbps)
Second generation hard processor system (HPS) with integrated ARM* Cortex*-A9* MPCore* processor	• Tight integration of a dual-core ARM Cortex-A9 MPCore processor, hard IP, and an FPGA in a single Intel Arria 10 system-on-a-chip (SoC) • Supports over 128 Gbps peak bandwidth with integrated data coherency between the processor and the FPGA fabric
Advanced power savings	• Comprehensive set of advanced power saving features • Power-optimized MultiTrack routing and core architecture • Up to 40% lower power compared to previous generation of mid-range FPGAs • Up to 60% lower power compared to previous generation of high-end FPGAs

Summary of Intel Arria 10 Features

Table 3. Summary of Features for Intel Arria 10 Devices

Feature	Description
Technology	• TSMC's 20-nm SoC process technology • Allows operation at a lower V_{CC} level of 0.82 V instead of the 0.9 V standard V_{CC} core voltage
Packaging	• 1.0 mm ball-pitch Fineline BGA packaging • 0.8 mm ball-pitch Ultra Fineline BGA packaging • Multiple devices with identical package footprints for seamless migration between different FPGA densities • Devices with compatible package footprints allow migration to next generation high-end Stratix® 10 devices • RoHS, leaded(1), and lead-free (Pb-free) options
High-performance FPGA fabric	• Enhanced 8-input ALM with four registers • Improved multi-track routing architecture to reduce congestion and improve compilation time • Hierarchical core clocking architecture • Fine-grained partial reconfiguration
Internal memory blocks	• M20K—20-Kb memory blocks with hard error correction code (ECC) • Memory logic array block (MLAB)—640-bit memory

(1) Contact Intel for availability.

Feature	Description	
Embedded Hard IP blocks	Variable-precision DSP	• Native support for signal processing precision levels from 18 x 19 to 54 x 54 • Native support for 27 x 27 multiplier mode • 64-bit accumulator and cascade for systolic finite impulse responses (FIRs) • Internal coefficient memory banks • Preadder/subtractor for improved efficiency • Additional pipeline register to increase performance and reduce power • Supports floating point arithmetic: — Perform multiplication, addition, subtraction, multiply-add, multiply-subtract, and complex multiplication. — Supports multiplication with accumulation capability, cascade summation, and cascade subtraction capability. — Dynamic accumulator reset control. — Support direct vector dot and complex multiplication chaining multiply floating point DSP blocks.
	Memory controller	DDR4, DDR3, and DDR3L
	PCI Express*	PCI Express (PCIe*) Gen3 (x1, x2, x4, or x8), Gen2 (x1, x2, x4, or x8) and Gen1 (x1, x2, x4, or x8) hard IP with complete protocol stack, endpoint, and root port
	Transceiver I/O	• 10GBASE-KR/40GBASE-KR4 Forward Error Correction (FEC) • PCS hard IPs that support: — 10-Gbps Ethernet (10GbE) — PCIe PIPE interface — Interlaken — Gbps Ethernet (GbE) — Common Public Radio Interface (CPRI) with deterministic latency support — Gigabit-capable passive optical network (GPON) with fast lock-time support • 13.5G JESD204b • 8B/10B, 64B/66B, 64B/67B encoders and decoders • Custom mode support for proprietary protocols
Core clock networks	• Up to 800 MHz fabric clocking, depending on the application: — 667 MHz external memory interface clocking with 2,400 Mbps DDR4 interface — 800 MHz LVDS interface clocking with 1,600 Mbps LVDS interface • Global, regional, and peripheral clock networks • Clock networks that are not used can be gated to reduce dynamic power	
Phase-locked loops (PLLs)	• High-resolution fractional synthesis PLLs: — Precision clock synthesis, clock delay compensation, and zero delay buffering (ZDB) — Support integer mode and fractional mode — Fractional mode support with third-order delta-sigma modulation • Integer PLLs: — Adjacent to general purpose I/Os — Support external memory and LVDS interfaces	
FPGA General-purpose I/Os (GPIOs)	• 1.6 Gbps LVDS—every pair can be configured as receiver or transmitter • On-chip termination (OCT) • 1.2 V to 3.0 V single-ended LVTTL/LVCMOS interfacing	
External Memory Interface	• Hard memory controller— DDR4, DDR3, and DDR3L support — DDR4—speeds up to 1,200 MHz/2,400 Mbps — DDR3—speeds up to 1,067 MHz/2,133 Mbps • Soft memory controller—provides support for RLDRAM 3(2), QDR IV(2), and QDR II+	

continued...

Feature	Description
	• Dynamic reconfiguration of the transceivers and PLLs • Fine-grained partial reconfiguration of the core fabric • Active Serial x4 Interface
Power management	• SmartVID • Low static power device options • Programmable Power Technology • Intel Quartus Prime integrated power analysis
Software and tools	• Intel Quartus Prime design suite • Transceiver toolkit • Platform Designer system integration tool • DSP Builder for Intel FPGAs • OpenCL™ support • Intel SoC FPGA Embedded Design Suite (EDS)

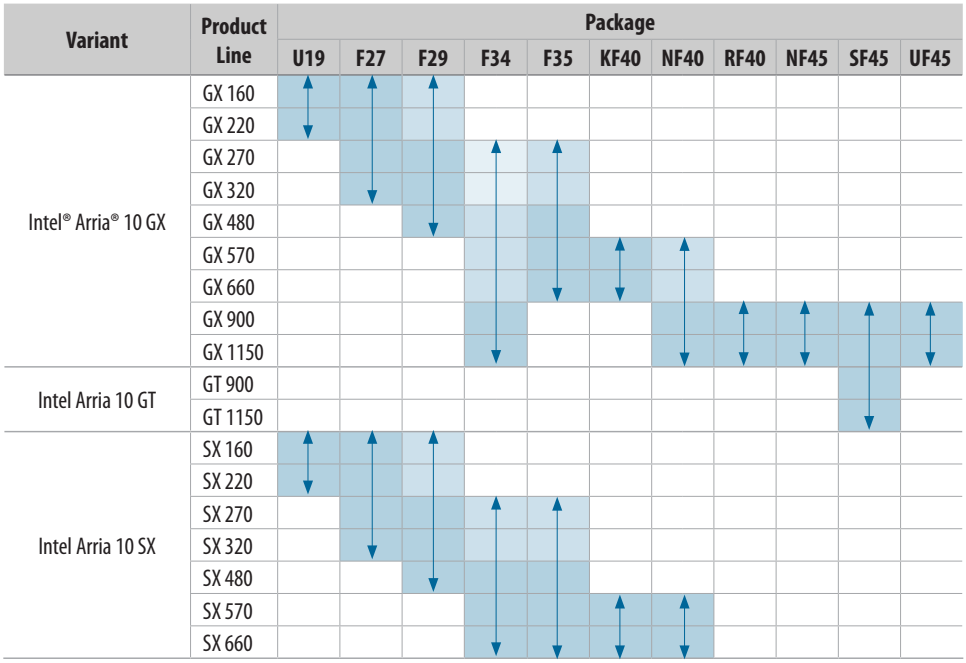
I/O Vertical Migration for Intel Arria 10 Devices

Figure 4. Migration Capability Across Intel Arria 10 Product Lines

- The arrows indicate the migration paths. The devices included in each vertical migration path are shaded. Devices with fewer resources in the same path have lighter shades.
- To achieve the full I/O migration across product lines in the same migration path, restrict I/Os and transceivers usage to match the product line with the lowest I/O and transceiver counts.
- An LVDS I/O bank in the source device may be mapped to a 3 V I/O bank in the target device. To use memory interface clock frequency higher than 533 MHz, assign external memory interface pins only to banks that are LVDS I/O in both devices.
- There may be nominal 0.15 mm package height difference between some product lines in the same package type.
- Some migration paths are not shown in the Intel Quartus Prime software **Pin Migration View**.



Note: To verify the pin migration compatibility, use the **Pin Migration View** window in the Intel Quartus Prime software Pin Planner.

Adaptive Logic Module

Intel Arria 10 devices use a 20 nm ALM as the basic building block of the logic fabric.

The ALM architecture is the same as the previous generation FPGAs, allowing for efficient implementation of logic functions and easy conversion of IP between the device generations.

The ALM, as shown in following figure, uses an 8-input fracturable look-up table (LUT) with four dedicated registers to help improve timing closure in register-rich designs and achieve an even higher design packing capability than the traditional two-register per LUT architecture.

Variant	Product Line	Variable-precision DSP Block	Independent Input and Output Multiplications Operator		18 x 19 Multiplier Adder Sum Mode	18 x 18 Multiplier Adder Summed with 36 bit Input
			18 x 19 Multiplier	27 x 27 Multiplier		
	SX 320	984	1,968	984	984	984
	SX 480	1,368	2,736	1,368	1,368	1,368
	SX 570	1,523	3,046	1,523	1,523	1,523

Embedded Memory Blocks

The embedded memory blocks in the devices are flexible and designed to provide an optimal amount of small- and large-sized memory arrays to fit your design requirements.

Types of Embedded Memory

The Intel Arria 10 devices contain two types of memory blocks:

- 20 Kb M20K blocks—blocks of dedicated memory resources. The M20K blocks are ideal for larger memory arrays while still providing a large number of independent ports.
- 640 bit memory logic array blocks (MLABs)—enhanced memory blocks that are configured from dual-purpose logic array blocks (LABs). The MLABs are ideal for wide and shallow memory arrays. The MLABs are optimized for implementation of shift registers for digital signal processing (DSP) applications, wide and shallow FIFO buffers, and filter delay lines. Each MLAB is made up of ten adaptive logic modules (ALMs). In the Intel Arria 10 devices, you can configure these ALMs as ten 32 x 2 blocks, giving you one 32 x 20 simple dual-port SRAM block per MLAB.

Embedded Memory Capacity in Intel Arria 10 Devices

Table 18. Embedded Memory Capacity and Distribution in Intel Arria 10 Devices

Variant	Product Line	M20K		MLAB		Total RAM Bit (Kb)
		Block	RAM Bit (Kb)	Block	RAM Bit (Kb)	
Intel Arria 10 GX	GX 160	440	8,800	1,680	1,050	9,850
	GX 220	587	11,740	2,703	1,690	13,430
	GX 270	750	15,000	3,922	2,452	17,452
	GX 320	891	17,820	4,363	2,727	20,547
	GX 480	1,431	28,620	6,662	4,164	32,784
	GX 570	1,800	36,000	8,153	5,096	41,096
	GX 660	2,131	42,620	9,260	5,788	48,408
	GX 900	2,423	48,460	15,017	9,386	57,846
	GX 1150	2,713	54,260	20,774	12,984	67,244
Intel Arria 10 GT	GT 900	2,423	48,460	15,017	9,386	57,846
	GT 1150	2,713	54,260	20,774	12,984	67,244

	SX 480	1,431	28,620	6,662	4,164	32,784
	SX 570	1,800	36,000	8,153	5,096	41,096
	SX 660	2,131	42,620	9,260	5,788	48,408

Embedded Memory Configurations for Single-port Mode

Table 19. Single-port Embedded Memory Configurations for Intel Arria 10 Devices

This table lists the maximum configurations supported for single-port RAM and ROM modes.

Memory Block	Depth (bits)	Programmable Width
MLAB	32	x16, x18, or x20
	64 (10)	x8, x9, x10
M20K	512	x40, x32
	1K	x20, x16
	2K	x10, x8
	4K	x5, x4
	8K	x2
	16K	x1

Clock Networks and PLL Clock Sources

The clock network architecture is based on Intel's global, regional, and peripheral clock structure. This clock structure is supported by dedicated clock input pins, fractional clock synthesis PLLs, and integer I/O PLLs.

Clock Networks

The Intel Arria 10 core clock networks are capable of up to 800 MHz fabric operation across the full industrial temperature range. For the external memory interface, the clock network supports the hard memory controller with speeds up to 2,400 Mbps in a quarter-rate transfer.

To reduce power consumption, the Intel Quartus Prime software identifies all unused sections of the clock network and powers them down.

Fractional Synthesis and I/O PLLs

Intel Arria 10 devices contain up to 32 fractional synthesis PLLs and up to 16 I/O PLLs that are available for both specific and general purpose uses in the core:

- Fractional synthesis PLLs—located in the column adjacent to the transceiver blocks
- I/O PLLs—located in each bank of the 48 I/Os

Fractional Synthesis PLLs

You can use the fractional synthesis PLLs to:

- Reduce the number of oscillators that are required on your board
- Reduce the number of clock pins that are used in the device by synthesizing multiple clock frequencies from a single reference clock source

(10) Supported through software emulation and consumes additional MLAB blocks.

The fractional synthesis PLLs support the following features:

- Reference clock frequency synthesis for transceiver CMU and Advanced Transmit (ATX) PLLs
- Clock network delay compensation
- Zero-delay buffering
- Direct transmit clocking for transceivers
- Independently configurable into two modes:
  - Conventional integer mode equivalent to the general purpose PLL
  - Enhanced fractional mode with third order delta-sigma modulation
- PLL cascading

I/O PLLs

The integer mode I/O PLLs are located in each bank of 48 I/Os. You can use the I/O PLLs to simplify the design of external memory and high-speed LVDS interfaces.

In each I/O bank, the I/O PLLs are adjacent to the hard memory controllers and LVDS SERDES. Because these PLLs are tightly coupled with the I/Os that need to use them, it makes it easier to close timing.

You can use the I/O PLLs for general purpose applications in the core such as clock network delay compensation and zero-delay buffering.

Intel Arria 10 devices support PLL-to-PLL cascading.

FPGA General Purpose I/O

Intel Arria 10 devices offer highly configurable GPIOs. Each I/O bank contains 48 general purpose I/Os and a high-efficiency hard memory controller.

The following list describes the features of the GPIOs:

- Consist of 3 V I/Os for high-voltage application and LVDS I/Os for differential signaling
  - Up to two 3 V I/O banks, available in some devices, that support up to 3 V I/O standards
  - LVDS I/O banks that support up to 1.8 V I/O standards
- Support a wide range of single-ended and differential I/O interfaces
- LVDS speeds up to 1.6 Gbps
- Each LVDS pair of pins has differential input and output buffers, allowing you to configure the LVDS direction for each pair.
- Programmable bus hold and weak pull-up
- Programmable differential output voltage (V_{OD}) and programmable pre-emphasis

Related Information

Intel Arria 10 Device Datasheet
Lists the memory interface performance according to memory interface standards, rank or chip select configurations, and Intel Arria 10 device speed grades.

PCIe Gen1, Gen2, and Gen3 Hard IP

Intel Arria 10 devices contain PCIe hard IP that is designed for performance and ease-of-use:

- Includes all layers of the PCIe stack—transaction, data link and physical layers.
- Supports PCIe Gen3, Gen2, and Gen1 Endpoint and Root Port in x1, x2, x4, or x8 lane configuration.
- Operates independently from the core logic—optional configuration via protocol (CvP) allows the PCIe link to power up and complete link training in less than 100 ms while the Intel Arria 10 device completes loading the programming file for the rest of the FPGA.
- Provides added functionality that makes it easier to support emerging features such as Single Root I/O Virtualization (SR-IOV) and optional protocol extensions.
- Provides improved end-to-end datapath protection using ECC.
- Supports FPGA configuration via protocol (CvP) using PCIe at Gen3, Gen2, or Gen1 speed.

Related Information

PCS Features on page 30

Enhanced PCS Hard IP for Interlaken and 10 Gbps Ethernet

Interlaken Support

The Intel Arria 10 enhanced PCS hard IP provides integrated Interlaken PCS supporting rates up to 25.8 Gbps per lane.

The Interlaken PCS is based on the proven functionality of the PCS developed for Intel's previous generation FPGAs, which demonstrated interoperability with Interlaken ASSP vendors and third-party IP suppliers. The Interlaken PCS is present in every transceiver channel in Intel Arria 10 devices.

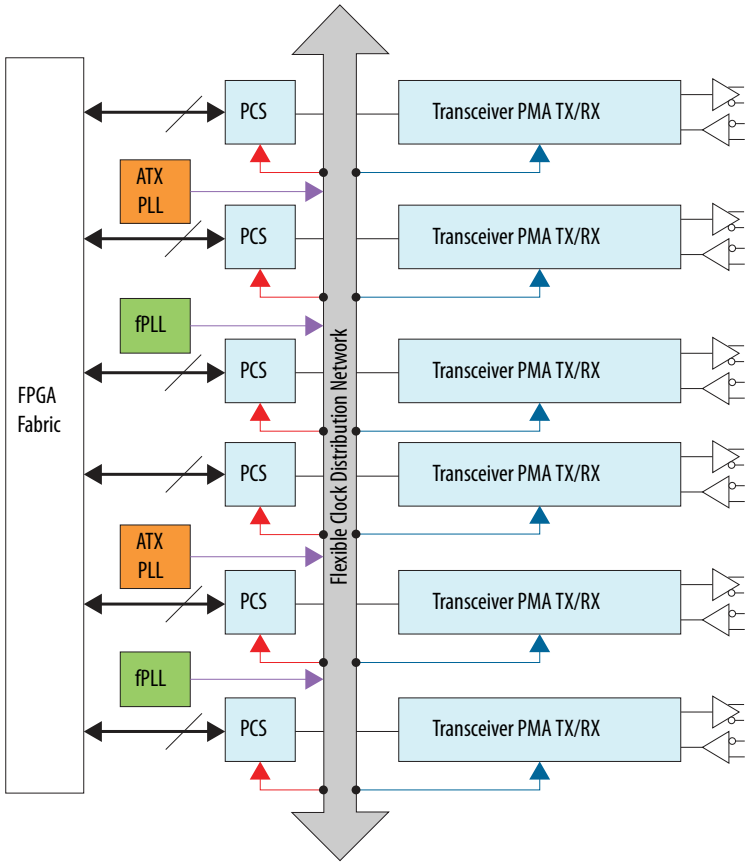
Related Information

PCS Features on page 30

10 Gbps Ethernet Support

The Intel Arria 10 enhanced PCS hard IP supports 10GBASE-R PCS compliant with IEEE 802.3 10 Gbps Ethernet (10GbE). The integrated hard IP support for 10GbE and the 10 Gbps transceivers save external PHY cost, board space, and system power.

Figure 6. Intel Arria 10 Transceiver Block Architecture



Transceiver Channels

All transceiver channels feature a dedicated Physical Medium Attachment (PMA) and a hardened Physical Coding Sublayer (PCS).

- The PMA provides primary interfacing capabilities to physical channels.
- The PCS typically handles encoding/decoding, word alignment, and other pre-processing functions before transferring data to the FPGA core fabric.

A transceiver channel consists of a PMA and a PCS block. Most transceiver banks have 6 channels. There are some transceiver banks that contain only 3 channels.

A wide variety of bonded and non-bonded data rate configurations is possible using a highly configurable clock distribution network. Up to 80 independent transceiver data rates can be configured.

The following figures are graphical representations of top views of the silicon die, which correspond to reverse views for flip chip packages. Different Intel Arria 10 devices may have different floorplans than the ones shown in the figures.

Figure 7. Device Chip Overview for Intel Arria 10 GX and GT Devices

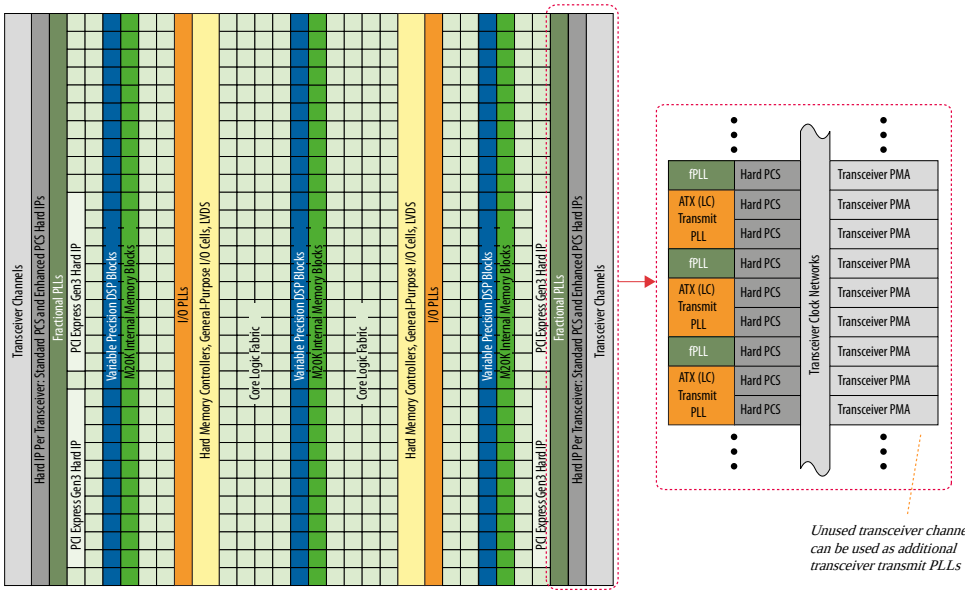


Figure 8. Device Chip Overview for Intel Arria 10 SX Devices

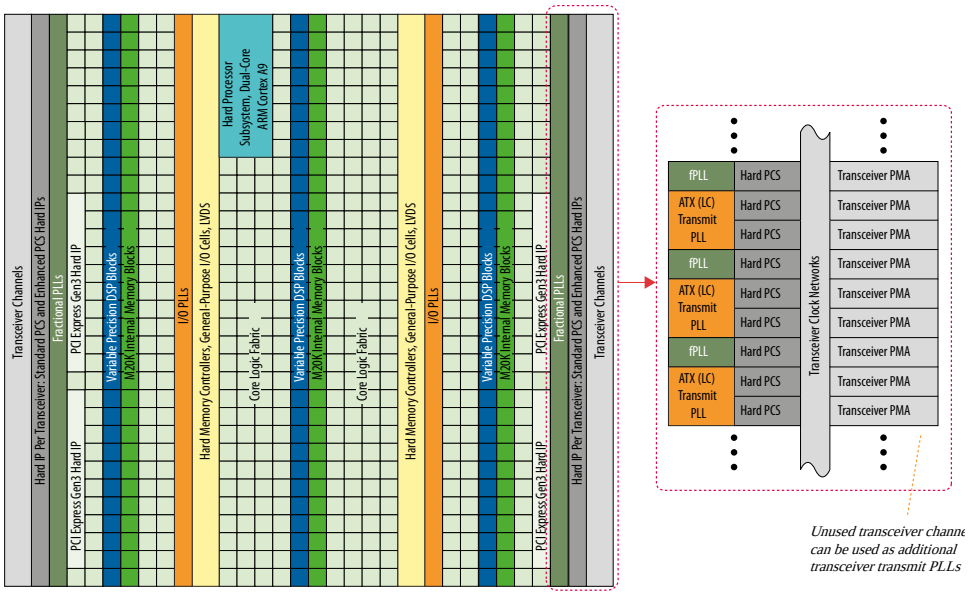
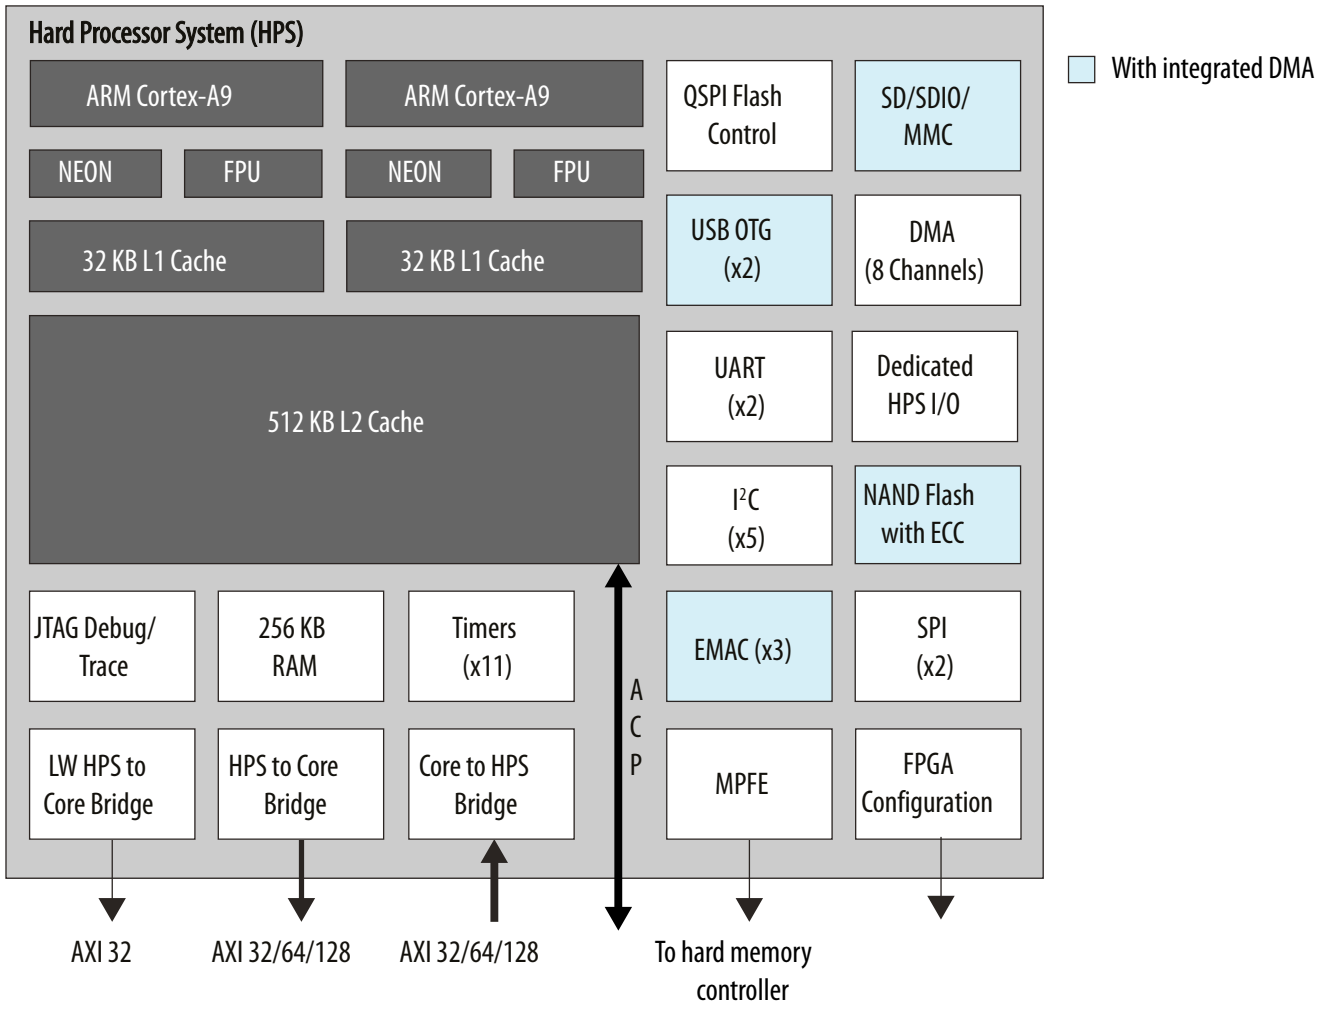


PMA Features

Intel Arria 10 transceivers provide exceptional signal integrity at data rates up to 25.8 Gbps. Clocking options include ultra-low jitter ATX PLLs (LC tank based), clock multiplier unit (CMU) PLLs, and fractional PLLs.

Figure 9. HPS Block Diagram

This figure shows a block diagram of the HPS with the dual ARM Cortex-A9 MPCore processor.



Key Advantages of 20-nm HPS

The 20-nm HPS strikes a balance between enabling maximum software compatibility with 28-nm SoCs while still improving upon the 28-nm HPS architecture. These improvements address the requirements of the next generation target markets such as wireless and wireline communications, compute and storage equipment, broadcast and military in terms of performance, memory bandwidth, connectivity via backplane and security.

Table 24. Improvements in 20 nm HPS

This table lists the key improvements of the 20 nm HPS compared to the 28 nm HPS.

Advantages/ Improvements	Description
Increased performance and overdrive capability	While the nominal processor frequency is 1.2 GHz, the 20 nm HPS offers an "overdrive" feature which enables a higher processor operating frequency. This requires a higher supply voltage value that is unique to the HPS and may require a separate regulator.
Increased processor memory bandwidth and DDR4 support	Up to 64-bit DDR4 memory at 2,400 Mbps support is available for the processor. The hard memory controller for the HPS comprises a multi-port front end that manages connections to a single port memory controller. The multi-port front end allows logic core and the HPS to share ports and thereby the available bandwidth of the memory controller.
Flexible I/O sharing	An advanced I/O pin muxing scheme allows improved sharing of I/O between the HPS and the core logic. The following types of I/O are available for SoC: • 17 dedicated I/Os—physically located inside the HPS block and are not accessible to logic within the core. The 17 dedicated I/Os are used for HPS clock, resets, and interfacing with boot devices, QSPI, and SD/MMC. • 48 direct shared I/O—located closest to the HPS block and are ideal for high speed HPS peripherals such as EMAC, USB, and others. There is one bank of 48 I/Os that supports direct sharing where the 48 I/Os can be shared 12 I/Os at a time. • Standard (shared) I/O—all standard I/Os can be shared by the HPS peripherals and any logic within the core. For designs where more than 48 I/Os are required to fully use all the peripherals in the HPS, these I/Os can be connected through the core logic.
EMAC core	Three EMAC cores are available in the HPS. The EMAC cores enable an application to support two redundant Ethernet connections; for example, backplane, or two EMAC cores for managing IEEE 1588 time stamp information while allowing a third EMAC core for debug and configuration. All three EMACs can potentially share the same time stamps, simplifying the 1588 time stamping implementation. A new serial time stamp interface allows core logic to access and read the time stamp values. The integrated EMAC controllers can be connected to external Ethernet PHY through the provided MDIO or I^2C interface.
On-chip memory	The on-chip memory is updated to 256 KB support and can support larger data sets and real time algorithms.
ECC enhancements	Improvements in L2 Cache ECC management allow identification of errors down to the address level. ECC enhancements also enable improved error injection and status reporting via the introduction of new memory mapped access to syndrome and data signals.
HPS to FPGA Interconnect Backbone	Although the HPS and the Logic Core can operate independently, they are tightly coupled via a high-bandwidth system interconnect built from high-performance ARM AMBA AXI bus bridges. IP bus masters in the FPGA fabric have access to HPS bus slaves via the FPGA-to-HPS interconnect. Similarly, HPS bus masters have access to bus slaves in the core fabric via the HPS-to-FPGA bridge. Both bridges are AMBA AXI-3 compliant and support simultaneous read and write transactions. Up to three masters within the core fabric can share the HPS SDRAM controller with the processor. Additionally, the processor can be used to configure the core fabric under program control via a dedicated 32-bit configuration port.
FPGA configuration and HPS booting	The FPGA fabric and HPS in the SoCs are powered independently. You can reduce the clock frequencies or gate the clocks to reduce dynamic power. You can configure the FPGA fabric and boot the HPS independently, in any order, providing you with more design flexibility.
Security	New security features have been introduced for anti-tamper management, secure boot, encryption (AES), and authentication (SHA).

Features of the HPS

The HPS has the following features:

- 1.2-GHz, dual-core ARM Cortex-A9 MPCore processor with up to 1.5-GHz via overdrive
  - — ARMv7-A architecture that runs 32-bit ARM instructions, 16-bit and 32-bit Thumb instructions, and 8-bit Java byte codes in Jazelle style
  - — Superscalar, variable length, out-of-order pipeline with dynamic branch prediction
  - — Instruction Efficiency 2.5 MIPS/MHz, which provides total performance of 7500 MIPS at 1.5 GHz
- Each processor core includes:
  - — 32 KB of L1 instruction cache, 32 KB of L1 data cache
  - — Single- and double-precision floating-point unit and NEON media engine
  - — CoreSight debug and trace technology
  - — Snoop Control Unit (SCU) and Acceleration Coherency Port (ACP)
- 512 KB of shared L2 cache
- 256 KB of scratch RAM
- Hard memory controller with support for DDR3, DDR4 and optional error correction code (ECC) support
- Multiport Front End (MPFE) Scheduler interface to the hard memory controller
- 8-channel direct memory access (DMA) controller
- QSPI flash controller with SIO, DIO, QIO SPI Flash support
- NAND flash controller (ONFI 1.0 or later) with DMA and ECC support, updated to support 8 and 16-bit Flash devices and new command DMA to offload CPU for fast power down recovery
- Updated SD/SDIO/MMC controller to eMMC 4.5 with DMA with CE-ATA digital command support
- 3 10/100/1000 Ethernet media access control (MAC) with DMA
- 2 USB On-the-Go (OTG) controllers with DMA
- 5 I^2C controllers (3 can be used by EMAC for MIO to external PHY)
- 2 UART 16550 Compatible controllers
- 4 serial peripheral interfaces (SPI) (2 Master, 2 Slaves)
- 62 programmable general-purpose I/Os, which includes 48 direct share I/Os that allows the HPS peripherals to connect directly to the FPGA I/Os
- 7 general-purpose timers
- 4 watchdog timers
- Anti-tamper, Secure Boot, Encryption (AES) and Authentication (SHA)

System Peripherals and Debug Access Port

Each Ethernet MAC, USB OTG, NAND flash controller, and SD/MMC controller module has an integrated DMA controller. For modules without an integrated DMA controller, an additional DMA controller module provides up to eight channels of high-bandwidth data transfers. Peripherals that communicate off-chip are multiplexed with other peripherals at the HPS pin level. This allows you to choose which peripherals interface with other devices on your PCB.

The debug access port provides interfaces to industry standard JTAG debug probes and supports ARM CoreSight debug and core traces to facilitate software development.

HPS–FPGA AXI Bridges

The HPS–FPGA bridges, which support the Advanced Microcontroller Bus Architecture (AMBA) Advanced eXtensible Interface (AXI™) specifications, consist of the following bridges:

- FPGA-to-HPS AMBA AXI bridge—a high-performance bus supporting 32, 64, and 128 bit data widths that allows the FPGA fabric to issue transactions to slaves in the HPS.
- HPS-to-FPGA Avalon/AMBA AXI bridge—a high-performance bus supporting 32, 64, and 128 bit data widths that allows the HPS to issue transactions to slaves in the FPGA fabric.
- Lightweight HPS-to-FPGA AXI bridge—a lower latency 32 bit width bus that allows the HPS to issue transactions to soft peripherals in the FPGA fabric. This bridge is primarily used for control and status register (CSR) accesses to peripherals in the FPGA fabric.

The HPS–FPGA AXI bridges allow masters in the FPGA fabric to communicate with slaves in the HPS logic, and vice versa. For example, the HPS-to-FPGA AXI bridge allows you to share memories instantiated in the FPGA fabric with one or both microprocessors in the HPS, while the FPGA-to-HPS AXI bridge allows logic in the FPGA fabric to access the memory and peripherals in the HPS.

Each HPS–FPGA bridge also provides asynchronous clock crossing for data transferred between the FPGA fabric and the HPS.

HPS SDRAM Controller Subsystem

The HPS SDRAM controller subsystem contains a multiport SDRAM controller and DDR PHY that are shared between the FPGA fabric (through the FPGA-to-HPS SDRAM interface), the level 2 (L2) cache, and the level 3 (L3) system interconnect. The FPGA-to-HPS SDRAM interface supports AMBA AXI and Avalon® Memory-Mapped (Avalon-MM) interface standards, and provides up to six individual ports for access by masters implemented in the FPGA fabric.

The HPS SDRAM controller supports up to 3 masters (command ports), 3x 64-bit read data ports and 3x 64-bit write data ports.

To maximize memory performance, the SDRAM controller subsystem supports command and data reordering, deficit round-robin arbitration with aging, and high-priority bypass features.

Date	Version	Changes
December 2015	2015.12.14	• Updated the number of M20K memory blocks for Arria 10 GX 660 from 2133 to 2131 and corrected the total RAM bit from 48,448 Kb to 48,408 Kb. • Corrected the number of DSP blocks for Arria 10 GX 660 from 1688 to 1687 in the table listing floating-point arithmetic resources.
November 2015	2015.11.02	• Updated the maximum resources for Arria 10 GX 220, GX 320, GX 480, GX 660, SX 220, SX 320, SX 480, and SX 660. • Updated resource count for Arria 10 GX 320, GX 480, GX 660, SX 320, SX 480, a SX 660 devices in **Number of Multipliers in Intel Arria 10 Devices** table. • Updated the available options for Arria 10 GX, GT, and SX. • Changed instances of *Quartus II* to *Quartus Prime*.
June 2015	2015.06.15	Corrected label for Intel Arria 10 GT product lines in the vertical migration figure.
May 2015	2015.05.15	Corrected the DDR3 half rate and quarter rate maximum frequencies in the table that lists the memory standards supported by the Intel Arria 10 hard memory controller.
May 2015	2015.05.04	• Added support for 13.5G JESD204b in the Summary of Features table. • Added a link to Arria 10 GT Channel Usage in the Arria 10 GT Package Plan topic. • Added a note to the table, Maximum Resource Counts for Arria 10 GT devices. • Updated the power requirements of the transceivers in the Low Power Serial Transceivers topic.
January 2015	2015.01.23	• Added floating point arithmetic features in the Summary of Features table. • Updated the total embedded memory from 38.38 megabits (Mb) to 65.6 Mb. • Updated the table that lists the memory standards supported by Intel Arria 10 devices. • Removed support for DDR3U, LPDDR3 SDRAM, RLDRAM 2, and DDR2. • Moved RLDRAM 3 support from hard memory controller to soft memory controller. RLDRAM 3 support uses hard PHY with soft memory controller. • Added soft memory controller support for QDR IV. • Updated the maximum resource count table to include the number of hard memory controllers available in each device variant. • Updated the transceiver PCS data rate from 12.5 Gbps to 12 Gbps. • Updated the max clock rate of PS, FPP x8, FPP x16, and Configuration via HPS from 125 MHz to 100 MHz. • Added a feature for fractional synthesis PLLs: PLL cascading. • Updated the HPS programmable general-purpose I/Os from 54 to 62.
September 2014	2014.09.30	• Corrected the 3 V I/O and LVDS I/O counts for F35 and F36 packages of Arria 10 GX. • Corrected the 3 V I/O, LVDS I/O, and transceiver counts for the NF40 package of the Arria GX 570 and 660. • Removed 3 V I/O, LVDS I/O, and transceiver counts for the NF40 package of the Arria GX 900 and 1150. The NF40 package is not available for Arria 10 GX 900 and 1150.

continued...

Date	Version	Changes
August 2014	2014.08.18	• Updated Memory (Kb) M20K maximum resources for Arria 10 GX 660 devices from 42,660 to 42,620. • Added GPIO columns consisting of LVDS I/O Bank and 3V I/O Bank in the Package Plan table. • Added how to use memory interface clock frequency higher than 533 MHz in the I/O vertical migration. • Added information to clarify that RLDRAM3 support uses hard PHY with soft memory controller. • Added variable precision DSP blocks support for floating-point arithmetic.
June 2014	2014.06.19	Updated number of dedicated I/Os in the HPS block to 17.
February 2014	2014.02.21	Updated transceiver speed grade options for GT devices in Figure 2.
February 2014	2014.02.06	Updated data rate for Arria 10 GT devices from 28.1 Gbps to 28.3 Gbps.
December 2013	2013.12.10	• Updated the HPS memory standards support from LPDDR2 to LPDDR3. • Updated HPS block diagram to include dedicated HPS I/O and FPGA Configuration blocks as well as repositioned SD/SDIO/MMC, DMA, SPI and NAND Flash with ECC blocks .
December 2013	2013.12.02	Initial release.
