Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details

Product Status	Active
Number of LABs/CLBs	427200
Number of Logic Elements/Cells	1150000
Total RAM Bits	68857856
Number of I/O	624
Number of Gates	-
Voltage - Supply	0.87V ~ 0.98V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	1932-BBGA, FCBGA
Supplier Device Package	1932-FCBGA (45x45)
Purchase URL	https://www.e-xfl.com/product-detail/intel/10ax115s2f45i2lg

Intel® Arria® 10 Device Overview

The Intel® Arria® 10 device family consists of high-performance and power-efficient 20 nm mid-range FPGAs and SoCs.

Intel Arria 10 device family delivers:

- Higher performance than the previous generation of mid-range and high-end FPGAs.
- Power efficiency attained through a comprehensive set of power-saving technologies.

The Intel Arria 10 devices are ideal for high performance, power-sensitive, midrange applications in diverse markets.

Table 1. Sample Markets and Ideal Applications for Intel Arria 10 Devices

Market	Applications
Wireless	• Channel and switch cards in remote radio heads • Mobile backhaul
Wireline	• 40G/100G muxponders and transponders • 100G line cards • Bridging • Aggregation
Broadcast	• Studio switches • Servers and transport • Videoconferencing • Professional audio and video
Computing and Storage	• Flash cache • Cloud computing servers • Server acceleration
Medical	• Diagnostic scanners • Diagnostic imaging
Military	• Missile guidance and control • Radar • Electronic warfare • Secure communications

Related Information

Intel Arria 10 Device Handbook: Known Issues

Lists the planned updates to the *Intel Arria 10 Device Handbook* chapters.

Feature	Description	
Low-power serial transceivers	- Continuous operating range: - Intel Arria 10 GX—1 Gbps to 17.4 Gbps - Intel Arria 10 GT—1 Gbps to 25.8 Gbps - Backplane support: - Intel Arria 10 GX—up to 12.5 - Intel Arria 10 GT—up to 12.5 - Extended range down to 125 Mbps with oversampling - ATX transmit PLLs with user-configurable fractional synthesis capability - Electronic Dispersion Compensation (EDC) support for XFP, SFP+, QSFP, and CFP optical module - Adaptive linear and decision feedback equalization - Transmitter pre-emphasis and de-emphasis - Dynamic partial reconfiguration of individual transceiver channels	
HPS (Intel Arria 10 SX devices only)	Processor and system	- Dual-core ARM Cortex-A9 MPCore processor—1.2 GHz CPU with 1.5 GHz overdrive capability 256 KB on-chip RAM and 64 KB on-chip ROM - System peripherals—general-purpose timers, watchdog timers, direct memory access (DMA) controller, FPGA configuration manager, and clock and reset managers - Security features—anti-tamper, secure boot, Advanced Encryption Standard (AES) and authentication (SHA) - ARM CoreSight* JTAG debug access port, trace port, and on-chip trace storage
	External interfaces	- Hard memory interface—Hard memory controller (2,400 Mbps DDR4, and 2,133 Mbps DDR3), Quad serial peripheral interface (QSPI) flash controller, NAND flash controller, direct memory access (DMA) controller, Secure Digital/MultiMediaCard (SD/MMC) controller - Communication interface— 10/100/1000 Ethernet media access control (MAC), USB On-The-Go (OTG) controllers, I²C controllers, UART 16550, serial peripheral interface (SPI), and up to 62 HPS GPIO interfaces (48 direct-share I/Os)
	Interconnects to core	- High-performance ARM AMBA* AXI bus bridges that support simultaneous read and write - HPS-FPGA bridges—include the FPGA-to-HPS, HPS-to-FPGA, and lightweight HPS-to-FPGA bridges that allow the FPGA fabric to issue transactions to slaves in the HPS, and vice versa - Configuration bridge that allows HPS configuration manager to configure the core logic via dedicated 32-bit configuration port - FPGA-to-HPS SDRAM controller bridge—provides configuration interfaces for the multiport front end (MPFE) of the HPS SDRAM controller
Configuration	- Tamper protection—comprehensive design protection to protect your valuable IP investments - Enhanced 256-bit advanced encryption standard (AES) design security with authentication - Configuration via protocol (CvP) using PCIe Gen1, Gen2, or Gen3	
continued...		

⁽²⁾ Intel Arria 10 devices support this external memory interface using hard PHY with soft memory controller.

Feature	Description
	- Dynamic reconfiguration of the transceivers and PLLs - Fine-grained partial reconfiguration of the core fabric - Active Serial x4 Interface
Power management	- SmartVID - Low static power device options - Programmable Power Technology - Intel Quartus Prime integrated power analysis
Software and tools	- Intel Quartus Prime design suite - Transceiver toolkit - Platform Designer system integration tool - DSP Builder for Intel FPGAs - OpenCL™ support - Intel SoC FPGA Embedded Design Suite (EDS)

I/O Vertical Migration for Intel Arria 10 Devices

Figure 4. Migration Capability Across Intel Arria 10 Product Lines

- The arrows indicate the migration paths. The devices included in each vertical migration path are shaded. Devices with fewer resources in the same path have lighter shades.
- To achieve the full I/O migration across product lines in the same migration path, restrict I/Os and transceivers usage to match the product line with the lowest I/O and transceiver counts.
- An LVDS I/O bank in the source device may be mapped to a 3 V I/O bank in the target device. To use memory interface clock frequency higher than 533 MHz, assign external memory interface pins only to banks that are LVDS I/O in both devices.
- There may be nominal 0.15 mm package height difference between some product lines in the same package type.
- Some migration paths are not shown in the Intel Quartus Prime software **Pin Migration View**.

Variant	Product Line	Package

Intel® Arria® 10 GX	GX 160	↑	↑	↑								
	GX 220	↓	↓	↓								
	GX 270		↓	↓	↑	↑						
	GX 320		↓	↓	↑	↑						
	GX 480			↓	↑	↑						
	GX 570				↑	↑	↑	↑				
	GX 660				↑	↑	↑	↑	↑	↑	↑	↑
	GX 900				↑			↑	↑	↑	↑	↑
	GX 1150				↑			↑	↑	↑	↑	↑
	GT 900										↑	↑
	GT 1150										↑	↑
Intel Arria 10 SX	SX 160	↑	↑	↑								
	SX 220	↓	↓	↓								
	SX 270		↓	↓	↑	↑						
	SX 320		↓	↓	↑	↑						
	SX 480			↓	↑	↑						
	SX 570				↑	↑	↑	↑				
	SX 660				↑	↑	↑	↑				

Note: To verify the pin migration compatibility, use the **Pin Migration View** window in the Intel Quartus Prime software Pin Planner.

Adaptive Logic Module

Intel Arria 10 devices use a 20 nm ALM as the basic building block of the logic fabric.

The ALM architecture is the same as the previous generation FPGAs, allowing for efficient implementation of logic functions and easy conversion of IP between the device generations.

The ALM, as shown in following figure, uses an 8-input fracturable look-up table (LUT) with four dedicated registers to help improve timing closure in register-rich designs and achieve an even higher design packing capability than the traditional two-register per LUT architecture.

Features for floating-point arithmetic:

- A completely hardened architecture that supports multiplication, addition, subtraction, multiply-add, and multiply-subtract
- Multiplication with accumulation capability and a dynamic accumulator reset control
- Multiplication with cascade summation capability
- Multiplication with cascade subtraction capability
- Complex multiplication
- Direct vector dot product
- Systolic FIR filter

Table 15. Variable-Precision DSP Block Configurations for Intel Arria 10 Devices

Usage Example	Multiplier Size (Bit)	DSP Block Resources
Medium precision fixed point	Two 18 x 19	1
High precision fixed or Single precision floating point	One 27 x 27	1
Fixed point FFTs	One 19 x 36 with external adder	1
Very high precision fixed point	One 36 x 36 with external adder	2
Double precision floating point	One 54 x 54 with external adder	4

Table 16. Resources for Fixed-Point Arithmetic in Intel Arria 10 Devices

The table lists the variable-precision DSP resources by bit precision for each Intel Arria 10 device.

Variant	Product Line	Variable-precision DSP Block	Independent Input and Output Multiplications Operator		18 x 19 Multiplier Adder Sum Mode	18 x 18 Multiplier Adder Summed with 36 bit Input
			18 x 19 Multiplier	27 x 27 Multiplier

Embedded Memory Configurations for Single-port Mode

Table 19. Single-port Embedded Memory Configurations for Intel Arria 10 Devices

This table lists the maximum configurations supported for single-port RAM and ROM modes.

Memory Block	Depth (bits)	Programmable Width
MLAB	32	x16, x18, or x20
	64 ⁽¹⁰⁾	x8, x9, x10
M20K	512	x40, x32
	1K	x20, x16
	2K	x10, x8
	4K	x5, x4
	8K	x2
	16K	x1

Clock Networks and PLL Clock Sources

The clock network architecture is based on Intel's global, regional, and peripheral clock structure. This clock structure is supported by dedicated clock input pins, fractional clock synthesis PLLs, and integer I/O PLLs.

Clock Networks

The Intel Arria 10 core clock networks are capable of up to 800 MHz fabric operation across the full industrial temperature range. For the external memory interface, the clock network supports the hard memory controller with speeds up to 2,400 Mbps in a quarter-rate transfer.

To reduce power consumption, the Intel Quartus Prime software identifies all unused sections of the clock network and powers them down.

Fractional Synthesis and I/O PLLs

Intel Arria 10 devices contain up to 32 fractional synthesis PLLs and up to 16 I/O PLLs that are available for both specific and general purpose uses in the core:

- Fractional synthesis PLLs—located in the column adjacent to the transceiver blocks
- I/O PLLs—located in each bank of the 48 I/Os

Fractional Synthesis PLLs

You can use the fractional synthesis PLLs to:

- Reduce the number of oscillators that are required on your board
- Reduce the number of clock pins that are used in the device by synthesizing multiple clock frequencies from a single reference clock source

⁽¹⁰⁾ Supported through software emulation and consumes additional MLAB blocks.

- Series (R_S) and parallel (R_T) on-chip termination (OCT) for all I/O banks with OCT calibration to limit the termination impedance variation
- On-chip dynamic termination that has the ability to swap between series and parallel termination, depending on whether there is read or write on a common bus for signal integrity
- Easy timing closure support using the hard read FIFO in the input register path, and delay-locked loop (DLL) delay chain with fine and coarse architecture

External Memory Interface

Intel Arria 10 devices offer massive external memory bandwidth, with up to seven 32-bit DDR4 memory interfaces running at up to 2,400 Mbps. This bandwidth provides additional ease of design, lower power, and resource efficiencies of hardened high-performance memory controllers.

The memory interface within Intel Arria 10 FPGAs and SoCs delivers the highest performance and ease of use. You can configure up to a maximum width of 144 bits when using the hard or soft memory controllers. If required, you can bypass the hard memory controller and use a soft controller implemented in the user logic.

Each I/O contains a hardened DDR read/write path (PHY) capable of performing key memory interface functionality such as read/write leveling, FIFO buffering to lower latency and improve margin, timing calibration, and on-chip termination.

The timing calibration is aided by the inclusion of hard microcontrollers based on Intel's Nios® II technology, specifically tailored to control the calibration of multiple memory interfaces. This calibration allows the Intel Arria 10 device to compensate for any changes in process, voltage, or temperature either within the Intel Arria 10 device itself, or within the external memory device. The advanced calibration algorithms ensure maximum bandwidth and robust timing margin across all operating conditions.

In addition to parallel memory interfaces, Intel Arria 10 devices support serial memory technologies such as the Hybrid Memory Cube (HMC). The HMC is supported by the Intel Arria 10 high-speed serial transceivers which connect up to four HMC links, with each link running at data rates up to 15 Gbps.

The I/Os are designed to provide high performance support for existing and emerging external memory standards.

PCS	Description
Standard PCS	- Operates at a data rate up to 12 Gbps - Supports protocols such as PCI-Express, CPRI 4.2+, GigE, IEEE 1588 in Hard PCS - Implements other protocols using Basic/Custom (Standard PCS) transceiver configuration rules.
Enhanced PCS	- Performs functions common to most serial data industry standards, such as word alignment, encoding/decoding, and framing, before data is sent or received off-chip through the PMA - Handles data transfer to and from the FPGA fabric - Handles data transfer internally to and from the PMA - Provides frequency compensation - Performs channel bonding for multi-channel low skew applications
PCIe Gen3 PCS	- Supports the seamless switching of Data and Clock between the Gen1, Gen2, and Gen3 data rates - Provides support for PIPE 3.0 features - Supports the PIPE interface with the Hard IP enabled, as well as with the Hard IP bypassed

PCS Protocol Support

This table lists some of the protocols supported by the Intel Arria 10 transceiver PCS. For more information about the blocks in the transmitter and receiver data paths, refer to the related information.

Protocol	Data Rate (Gbps)	Transceiver IP	PCS Support
PCIe Gen3 x1, x2, x4, x8	8.0	Native PHY (PIPE)	Standard PCS and PCIe Gen3 PCS
PCIe Gen2 x1, x2, x4, x8	5.0	Native PHY (PIPE)	Standard PCS
PCIe Gen1 x1, x2, x4, x8	2.5	Native PHY (PIPE)	Standard PCS
1000BASE-X Gigabit Ethernet	1.25	Native PHY	Standard PCS
1000BASE-X Gigabit Ethernet with IEEE 1588v2	1.25	Native PHY	Standard PCS
10GBASE-R	10.3125	Native PHY	Enhanced PCS
10GBASE-R with IEEE 1588v2	10.3125	Native PHY	Enhanced PCS
10GBASE-R with KR FEC	10.3125	Native PHY	Enhanced PCS
10GBASE-KR and 1000BASE-X	10.3125	1G/10GbE and 10GBASE-KR PHY	Standard PCS and Enhanced PCS
Interlaken (CEI-6G/11G)	3.125 to 17.4	Native PHY	Enhanced PCS
SFI-S/SFI-5.2	11.2	Native PHY	Enhanced PCS
10G SDI	10.692	Native PHY	Enhanced PCS

Figure 9. HPS Block Diagram

This figure shows a block diagram of the HPS with the dual ARM Cortex-A9 MPCore processor.

Key Advantages of 20-nm HPS

The 20-nm HPS strikes a balance between enabling maximum software compatibility with 28-nm SoCs while still improving upon the 28-nm HPS architecture. These improvements address the requirements of the next generation target markets such as wireless and wireline communications, compute and storage equipment, broadcast and military in terms of performance, memory bandwidth, connectivity via backplane and security.

Table 24. Improvements in 20 nm HPS

This table lists the key improvements of the 20 nm HPS compared to the 28 nm HPS.

Advantages/ Improvements	Description
Increased performance and overdrive capability	While the nominal processor frequency is 1.2 GHz, the 20 nm HPS offers an “overdrive” feature which enables a higher processor operating frequency. This requires a higher supply voltage value that is unique to the HPS and may require a separate regulator.
Increased processor memory bandwidth and DDR4 support	Up to 64-bit DDR4 memory at 2,400 Mbps support is available for the processor. The hard memory controller for the HPS comprises a multi-port front end that manages connections to a single port memory controller. The multi-port front end allows logic core and the HPS to share ports and thereby the available bandwidth of the memory controller.
Flexible I/O sharing	An advanced I/O pin muxing scheme allows improved sharing of I/O between the HPS and the core logic. The following types of I/O are available for SoC: • 17 dedicated I/Os—physically located inside the HPS block and are not accessible to logic within the core. The 17 dedicated I/Os are used for HPS clock, resets, and interfacing with boot devices, QSPI, and SD/MMC. • 48 direct shared I/O—located closest to the HPS block and are ideal for high speed HPS peripherals such as EMAC, USB, and others. There is one bank of 48 I/Os that supports direct sharing where the 48 I/Os can be shared 12 I/Os at a time. • Standard (shared) I/O—all standard I/Os can be shared by the HPS peripherals and any logic within the core. For designs where more than 48 I/Os are required to fully use all the peripherals in the HPS, these I/Os can be connected through the core logic.
EMAC core	Three EMAC cores are available in the HPS. The EMAC cores enable an application to support two redundant Ethernet connections; for example, backplane, or two EMAC cores for managing IEEE 1588 time stamp information while allowing a third EMAC core for debug and configuration. All three EMACs can potentially share the same time stamps, simplifying the 1588 time stamping implementation. A new serial time stamp interface allows core logic to access and read the time stamp values. The integrated EMAC controllers can be connected to external Ethernet PHY through the provided MDIO or I ² C interface.
On-chip memory	The on-chip memory is updated to 256 KB support and can support larger data sets and real time algorithms.
ECC enhancements	Improvements in L2 Cache ECC management allow identification of errors down to the address level. ECC enhancements also enable improved error injection and status reporting via the introduction of new memory mapped access to syndrome and data signals.
HPS to FPGA Interconnect Backbone	Although the HPS and the Logic Core can operate independently, they are tightly coupled via a high-bandwidth system interconnect built from high-performance ARM AMBA AXI bus bridges. IP bus masters in the FPGA fabric have access to HPS bus slaves via the FPGA-to-HPS interconnect. Similarly, HPS bus masters have access to bus slaves in the core fabric via the HPS-to-FPGA bridge. Both bridges are AMBA AXI-3 compliant and support simultaneous read and write transactions. Up to three masters within the core fabric can share the HPS SDRAM controller with the processor. Additionally, the processor can be used to configure the core fabric under program control via a dedicated 32-bit configuration port.
FPGA configuration and HPS booting	The FPGA fabric and HPS in the SoCs are powered independently. You can reduce the clock frequencies or gate the clocks to reduce dynamic power. You can configure the FPGA fabric and boot the HPS independently, in any order, providing you with more design flexibility.
Security	New security features have been introduced for anti-tamper management, secure boot, encryption (AES), and authentication (SHA).

System Peripherals and Debug Access Port

Each Ethernet MAC, USB OTG, NAND flash controller, and SD/MMC controller module has an integrated DMA controller. For modules without an integrated DMA controller, an additional DMA controller module provides up to eight channels of high-bandwidth data transfers. Peripherals that communicate off-chip are multiplexed with other peripherals at the HPS pin level. This allows you to choose which peripherals interface with other devices on your PCB.

The debug access port provides interfaces to industry standard JTAG debug probes and supports ARM CoreSight debug and core traces to facilitate software development.

HPS-FPGA AXI Bridges

The HPS-FPGA bridges, which support the Advanced Microcontroller Bus Architecture (AMBA) Advanced eXtensible Interface (AXI™) specifications, consist of the following bridges:

- FPGA-to-HPS AMBA AXI bridge—a high-performance bus supporting 32, 64, and 128 bit data widths that allows the FPGA fabric to issue transactions to slaves in the HPS.
- HPS-to-FPGA Avalon/AMBA AXI bridge—a high-performance bus supporting 32, 64, and 128 bit data widths that allows the HPS to issue transactions to slaves in the FPGA fabric.
- Lightweight HPS-to-FPGA AXI bridge—a lower latency 32 bit width bus that allows the HPS to issue transactions to soft peripherals in the FPGA fabric. This bridge is primarily used for control and status register (CSR) accesses to peripherals in the FPGA fabric.

The HPS-FPGA AXI bridges allow masters in the FPGA fabric to communicate with slaves in the HPS logic, and vice versa. For example, the HPS-to-FPGA AXI bridge allows you to share memories instantiated in the FPGA fabric with one or both microprocessors in the HPS, while the FPGA-to-HPS AXI bridge allows logic in the FPGA fabric to access the memory and peripherals in the HPS.

Each HPS-FPGA bridge also provides asynchronous clock crossing for data transferred between the FPGA fabric and the HPS.

HPS SDRAM Controller Subsystem

The HPS SDRAM controller subsystem contains a multiport SDRAM controller and DDR PHY that are shared between the FPGA fabric (through the FPGA-to-HPS SDRAM interface), the level 2 (L2) cache, and the level 3 (L3) system interconnect. The FPGA-to-HPS SDRAM interface supports AMBA AXI and Avalon® Memory-Mapped (Avalon-MM) interface standards, and provides up to six individual ports for access by masters implemented in the FPGA fabric.

The HPS SDRAM controller supports up to 3 masters (command ports), 3x 64-bit read data ports and 3x 64-bit write data ports.

To maximize memory performance, the SDRAM controller subsystem supports command and data reordering, deficit round-robin arbitration with aging, and high-priority bypass features.

FPGA Configuration and HPS Booting

The FPGA fabric and HPS in the SoC FPGA must be powered at the same time. You can reduce the clock frequencies or gate the clocks to reduce dynamic power.

Once powered, the FPGA fabric and HPS can be configured independently thus providing you with more design flexibility:

- You can boot the HPS independently. After the HPS is running, the HPS can fully or partially reconfigure the FPGA fabric at any time under software control. The HPS can also configure other FPGAs on the board through the FPGA configuration controller.
- Configure the FPGA fabric first, and then boot the HPS from memory accessible to the FPGA fabric.

Hardware and Software Development

For hardware development, you can configure the HPS and connect your soft logic in the FPGA fabric to the HPS interfaces using the Platform Designer system integration tool in the Intel Quartus Prime software.

For software development, the ARM-based SoC FPGA devices inherit the rich software development ecosystem available for the ARM Cortex-A9 MPCore processor. The software development process for Intel SoC FPGAs follows the same steps as those for other SoC devices from other manufacturers. Support for Linux*, VxWorks*, and other operating systems are available for the SoC FPGAs. For more information on the operating systems support availability, contact the Intel FPGA sales team.

You can begin device-specific firmware and software development on the Intel SoC FPGA Virtual Target. The Virtual Target is a fast PC-based functional simulation of a target development system—a model of a complete development board. The Virtual Target enables the development of device-specific production software that can run unmodified on actual hardware.

Dynamic and Partial Reconfiguration

The Intel Arria 10 devices support dynamic and partial reconfiguration. You can use dynamic and partial reconfiguration simultaneously to enable seamless reconfiguration of both the device core and transceivers.

Dynamic Reconfiguration

You can reconfigure the PMA and PCS blocks while the device continues to operate. This feature allows you to change the data rates, protocol, and analog settings of a channel in a transceiver bank without affecting on-going data transfer in other transceiver banks. This feature is ideal for applications that require dynamic multiprotocol or multirate support.

Partial Reconfiguration

Using partial reconfiguration, you can reconfigure some parts of the device while keeping the device in operation.

Date	Version	Changes
August 2014	2014.08.18	- Updated Memory (Kb) M20K maximum resources for Arria 10 GX 660 devices from 42,660 to 42,620. - Added GPIO columns consisting of LVDS I/O Bank and 3V I/O Bank in the Package Plan table. - Added how to use memory interface clock frequency higher than 533 MHz in the I/O vertical migration. - Added information to clarify that RLDRAM3 support uses hard PHY with soft memory controller. - Added variable precision DSP blocks support for floating-point arithmetic.
June 2014	2014.06.19	Updated number of dedicated I/Os in the HPS block to 17.
February 2014	2014.02.21	Updated transceiver speed grade options for GT devices in Figure 2.
February 2014	2014.02.06	Updated data rate for Arria 10 GT devices from 28.1 Gbps to 28.3 Gbps.
December 2013	2013.12.10	- Updated the HPS memory standards support from LPDDR2 to LPDDR3. - Updated HPS block diagram to include dedicated HPS I/O and FPGA Configuration blocks as well as repositioned SD/SDIO/MMC, DMA, SPI and NAND Flash with ECC blocks .
December 2013	2013.12.02	Initial release.
