Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details

Product Status	Active
Number of LABs/CLBs	427200
Number of Logic Elements/Cells	1150000
Total RAM Bits	68857856
Number of I/O	480
Number of Gates	-
Voltage - Supply	0.87V ~ 0.93V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	1932-BBGA, FCBGA
Supplier Device Package	1932-FCBGA (45x45)
Purchase URL	https://www.e-xfl.com/product-detail/intel/10ax115u4f45i3lg

Key Advantages of Intel Arria 10 Devices

Table 2. Key Advantages of the Intel Arria 10 Device Family

Advantage	Supporting Feature
Enhanced core architecture	- Built on TSMC's 20 nm process technology 60% higher performance than the previous generation of mid-range FPGAs 15% higher performance than the fastest previous-generation FPGA
High-bandwidth integrated transceivers	- Short-reach rates up to 25.8 Gigabits per second (Gbps) - Backplane capability up to 12.5 Gbps - Integrated 10GBASE-KR and 40GBASE-KR4 Forward Error Correction (FEC)
Improved logic integration and hard IP blocks	8-input adaptive logic module (ALM) - Up to 65.6 megabits (Mb) of embedded memory - Variable-precision digital signal processing (DSP) blocks - Fractional synthesis phase-locked loops (PLLs) - Hard PCI Express Gen3 IP blocks - Hard memory controllers and PHY up to 2,400 Megabits per second (Mbps)
Second generation hard processor system (HPS) with integrated ARM* Cortex*-A9* MPCore* processor	- Tight integration of a dual-core ARM Cortex-A9 MPCore processor, hard IP, and an FPGA in a single Intel Arria 10 system-on-a-chip (SoC) - Supports over 128 Gbps peak bandwidth with integrated data coherency between the processor and the FPGA fabric
Advanced power savings	- Comprehensive set of advanced power saving features - Power-optimized MultiTrack routing and core architecture - Up to 40% lower power compared to previous generation of mid-range FPGAs - Up to 60% lower power compared to previous generation of high-end FPGAs

Summary of Intel Arria 10 Features

Table 3. Summary of Features for Intel Arria 10 Devices

Feature	Description
Technology	- TSMC's 20-nm SoC process technology - Allows operation at a lower V_{CC} level of 0.82 V instead of the 0.9 V standard V_{CC} core voltage
Packaging	1.0 mm ball-pitch FINELINE BGA packaging 0.8 mm ball-pitch Ultra FINELINE BGA packaging - Multiple devices with identical package footprints for seamless migration between different FPGA densities - Devices with compatible package footprints allow migration to next generation high-end Stratix® 10 devices - RoHS, leaded⁽¹⁾, and lead-free (Pb-free) options
High-performance FPGA fabric	- Enhanced 8-input ALM with four registers - Improved multi-track routing architecture to reduce congestion and improve compilation time - Hierarchical core clocking architecture - Fine-grained partial reconfiguration
Internal memory blocks	- M20K—20-Kb memory blocks with hard error correction code (ECC) - Memory logic array block (MLAB)—640-bit memory
continued...	

(1) Contact Intel for availability.

Feature	Description	
Embedded Hard IP blocks	Variable-precision DSP	- Native support for signal processing precision levels from 18 x 19 to 54 x 54 - Native support for 27 x 27 multiplier mode 64-bit accumulator and cascade for systolic finite impulse responses (FIRs) - Internal coefficient memory banks - Padder/subtractor for improved efficiency - Additional pipeline register to increase performance and reduce power - Supports floating point arithmetic: - Perform multiplication, addition, subtraction, multiply-add, multiply-subtract, and complex multiplication. - Supports multiplication with accumulation capability, cascade summation, and cascade subtraction capability. - Dynamic accumulator reset control. - Support direct vector dot and complex multiplication chaining multiply floating point DSP blocks.
	Memory controller	DDR4, DDR3, and DDR3L
	PCI Express*	PCI Express (PCIe*) Gen3 (x1, x2, x4, or x8), Gen2 (x1, x2, x4, or x8) and Gen1 (x1, x2, x4, or x8) hard IP with complete protocol stack, endpoint, and root port
	Transceiver I/O	10GBASE-KR/40GBASE-KR4 Forward Error Correction (FEC) - PCS hard IPs that support: 10-Gbps Ethernet (10GbE) - PCIe PIPE interface - Interlaken - Gbps Ethernet (GbE) - Common Public Radio Interface (CPRI) with deterministic latency support - Gigabit-capable passive optical network (GPON) with fast lock-time support 13.5G JESD204b 8B/10B, 64B/66B, 64B/67B encoders and decoders - Custom mode support for proprietary protocols
Core clock networks	- Up to 800 MHz fabric clocking, depending on the application: 667 MHz external memory interface clocking with 2,400 Mbps DDR4 interface 800 MHz LVDS interface clocking with 1,600 Mbps LVDS interface - Global, regional, and peripheral clock networks - Clock networks that are not used can be gated to reduce dynamic power	
Phase-locked loops (PLLs)	- High-resolution fractional synthesis PLLs: - Precision clock synthesis, clock delay compensation, and zero delay buffering (ZDB) - Support integer mode and fractional mode - Fractional mode support with third-order delta-sigma modulation - Integer PLLs: - Adjacent to general purpose I/Os - Support external memory and LVDS interfaces	
FPGA General-purpose I/Os (GPIOs)	1.6 Gbps LVDS—every pair can be configured as receiver or transmitter - On-chip termination (OCT) 1.2 V to 3.0 V single-ended LVTTTL/LVCMOS interfacing	
External Memory Interface	- Hard memory controller— DDR4, DDR3, and DDR3L support - DDR4—speeds up to 1,200 MHz/2,400 Mbps - DDR3—speeds up to 1,067 MHz/2,133 Mbps - Soft memory controller—provides support for RLDRAM 3⁽²⁾, QDR IV⁽²⁾, and QDR II+

I/O Vertical Migration for Intel Arria 10 Devices

Figure 4. Migration Capability Across Intel Arria 10 Product Lines

- The arrows indicate the migration paths. The devices included in each vertical migration path are shaded. Devices with fewer resources in the same path have lighter shades.
- To achieve the full I/O migration across product lines in the same migration path, restrict I/Os and transceivers usage to match the product line with the lowest I/O and transceiver counts.
- An LVDS I/O bank in the source device may be mapped to a 3 V I/O bank in the target device. To use memory interface clock frequency higher than 533 MHz, assign external memory interface pins only to banks that are LVDS I/O in both devices.
- There may be nominal 0.15 mm package height difference between some product lines in the same package type.
- Some migration paths are not shown in the Intel Quartus Prime software **Pin Migration View**.

Variant	Product Line	Package

Note: To verify the pin migration compatibility, use the **Pin Migration View** window in the Intel Quartus Prime software Pin Planner.

Adaptive Logic Module

Intel Arria 10 devices use a 20 nm ALM as the basic building block of the logic fabric.

The ALM architecture is the same as the previous generation FPGAs, allowing for efficient implementation of logic functions and easy conversion of IP between the device generations.

The ALM, as shown in following figure, uses an 8-input fracturable look-up table (LUT) with four dedicated registers to help improve timing closure in register-rich designs and achieve an even higher design packing capability than the traditional two-register per LUT architecture.

Features for floating-point arithmetic:

- A completely hardened architecture that supports multiplication, addition, subtraction, multiply-add, and multiply-subtract
- Multiplication with accumulation capability and a dynamic accumulator reset control
- Multiplication with cascade summation capability
- Multiplication with cascade subtraction capability
- Complex multiplication
- Direct vector dot product
- Systolic FIR filter

Table 15. Variable-Precision DSP Block Configurations for Intel Arria 10 Devices

Usage Example	Multiplier Size (Bit)	DSP Block Resources
Medium precision fixed point	Two 18 x 19	1
High precision fixed or Single precision floating point	One 27 x 27	1
Fixed point FFTs	One 19 x 36 with external adder	1
Very high precision fixed point	One 36 x 36 with external adder	2
Double precision floating point	One 54 x 54 with external adder	4

Table 16. Resources for Fixed-Point Arithmetic in Intel Arria 10 Devices

	SX 660	1,687	1,687	1,687	1,687	1,518

Embedded Memory Blocks

The embedded memory blocks in the devices are flexible and designed to provide an optimal amount of small- and large-sized memory arrays to fit your design requirements.

The fractional synthesis PLLs support the following features:

- Reference clock frequency synthesis for transceiver CMU and Advanced Transmit (ATX) PLLs
- Clock network delay compensation
- Zero-delay buffering
- Direct transmit clocking for transceivers
- Independently configurable into two modes:
 - Conventional integer mode equivalent to the general purpose PLL
 - Enhanced fractional mode with third order delta-sigma modulation
- PLL cascading

I/O PLLs

The integer mode I/O PLLs are located in each bank of 48 I/Os. You can use the I/O PLLs to simplify the design of external memory and high-speed LVDS interfaces.

In each I/O bank, the I/O PLLs are adjacent to the hard memory controllers and LVDS SERDES. Because these PLLs are tightly coupled with the I/Os that need to use them, it makes it easier to close timing.

You can use the I/O PLLs for general purpose applications in the core such as clock network delay compensation and zero-delay buffering.

Intel Arria 10 devices support PLL-to-PLL cascading.

FPGA General Purpose I/O

Intel Arria 10 devices offer highly configurable GPIOs. Each I/O bank contains 48 general purpose I/Os and a high-efficiency hard memory controller.

The following list describes the features of the GPIOs:

- Consist of 3 V I/Os for high-voltage application and LVDS I/Os for differential signaling
 - Up to two 3 V I/O banks, available in some devices, that support up to 3 V I/O standards
 - LVDS I/O banks that support up to 1.8 V I/O standards
- Support a wide range of single-ended and differential I/O interfaces
- LVDS speeds up to 1.6 Gbps
- Each LVDS pair of pins has differential input and output buffers, allowing you to configure the LVDS direction for each pair.
- Programmable bus hold and weak pull-up
- Programmable differential output voltage (V_{OD}) and programmable pre-emphasis

- Series (R_S) and parallel (R_T) on-chip termination (OCT) for all I/O banks with OCT calibration to limit the termination impedance variation
- On-chip dynamic termination that has the ability to swap between series and parallel termination, depending on whether there is read or write on a common bus for signal integrity
- Easy timing closure support using the hard read FIFO in the input register path, and delay-locked loop (DLL) delay chain with fine and coarse architecture

External Memory Interface

Intel Arria 10 devices offer massive external memory bandwidth, with up to seven 32-bit DDR4 memory interfaces running at up to 2,400 Mbps. This bandwidth provides additional ease of design, lower power, and resource efficiencies of hardened high-performance memory controllers.

The memory interface within Intel Arria 10 FPGAs and SoCs delivers the highest performance and ease of use. You can configure up to a maximum width of 144 bits when using the hard or soft memory controllers. If required, you can bypass the hard memory controller and use a soft controller implemented in the user logic.

Each I/O contains a hardened DDR read/write path (PHY) capable of performing key memory interface functionality such as read/write leveling, FIFO buffering to lower latency and improve margin, timing calibration, and on-chip termination.

The timing calibration is aided by the inclusion of hard microcontrollers based on Intel's Nios® II technology, specifically tailored to control the calibration of multiple memory interfaces. This calibration allows the Intel Arria 10 device to compensate for any changes in process, voltage, or temperature either within the Intel Arria 10 device itself, or within the external memory device. The advanced calibration algorithms ensure maximum bandwidth and robust timing margin across all operating conditions.

In addition to parallel memory interfaces, Intel Arria 10 devices support serial memory technologies such as the Hybrid Memory Cube (HMC). The HMC is supported by the Intel Arria 10 high-speed serial transceivers which connect up to four HMC links, with each link running at data rates up to 15 Gbps.

Provides a parametric tool that allows you to find and compare the performance of the supported external memory interfaces in IntelFPGAs.

Memory Standards Supported by Intel Arria 10 Devices

The I/Os are designed to provide high performance support for existing and emerging external memory standards.

Related Information

[Intel Arria 10 Device Datasheet](#)

Lists the memory interface performance according to memory interface standards, rank or chip select configurations, and Intel Arria 10 device speed grades.

PCIe Gen1, Gen2, and Gen3 Hard IP

Intel Arria 10 devices contain PCIe hard IP that is designed for performance and ease-of-use:

- Includes all layers of the PCIe stack—transaction, data link and physical layers.
- Supports PCIe Gen3, Gen2, and Gen1 Endpoint and Root Port in x1, x2, x4, or x8 lane configuration.
- Operates independently from the core logic—optional configuration via protocol (CvP) allows the PCIe link to power up and complete link training in less than 100 ms while the Intel Arria 10 device completes loading the programming file for the rest of the FPGA.
- Provides added functionality that makes it easier to support emerging features such as Single Root I/O Virtualization (SR-IOV) and optional protocol extensions.
- Provides improved end-to-end datapath protection using ECC.
- Supports FPGA configuration via protocol (CvP) using PCIe at Gen3, Gen2, or Gen1 speed.

[PCS Features](#) on page 30

Enhanced PCS Hard IP for Interlaken and 10 Gbps Ethernet

Interlaken Support

The Intel Arria 10 enhanced PCS hard IP provides integrated Interlaken PCS supporting rates up to 25.8 Gbps per lane.

The Interlaken PCS is based on the proven functionality of the PCS developed for Intel's previous generation FPGAs, which demonstrated interoperability with Interlaken ASSP vendors and third-party IP suppliers. The Interlaken PCS is present in every transceiver channel in Intel Arria 10 devices.

Related Information

[PCS Features](#) on page 30

10 Gbps Ethernet Support

The Intel Arria 10 enhanced PCS hard IP supports 10GBASE-R PCS compliant with IEEE 802.3 10 Gbps Ethernet (10GbE). The integrated hard IP support for 10GbE and the 10 Gbps transceivers save external PHY cost, board space, and system power.

Figure 7. Device Chip Overview for Intel Arria 10 GX and GT Devices

Figure 8. Device Chip Overview for Intel Arria 10 SX Devices

PMA Features

Intel Arria 10 transceivers provide exceptional signal integrity at data rates up to 25.8 Gbps. Clocking options include ultra-low jitter ATX PLLs (LC tank based), clock multiplier unit (CMU) PLLs, and fractional PLLs.

Figure 9. HPS Block Diagram

This figure shows a block diagram of the HPS with the dual ARM Cortex-A9 MPCore processor.

Key Advantages of 20-nm HPS

The 20-nm HPS strikes a balance between enabling maximum software compatibility with 28-nm SoCs while still improving upon the 28-nm HPS architecture. These improvements address the requirements of the next generation target markets such as wireless and wireline communications, compute and storage equipment, broadcast and military in terms of performance, memory bandwidth, connectivity via backplane and security.

Table 24. Improvements in 20 nm HPS

This table lists the key improvements of the 20 nm HPS compared to the 28 nm HPS.

Advantages/ Improvements	Description
Increased performance and overdrive capability	While the nominal processor frequency is 1.2 GHz, the 20 nm HPS offers an “overdrive” feature which enables a higher processor operating frequency. This requires a higher supply voltage value that is unique to the HPS and may require a separate regulator.
Increased processor memory bandwidth and DDR4 support	Up to 64-bit DDR4 memory at 2,400 Mbps support is available for the processor. The hard memory controller for the HPS comprises a multi-port front end that manages connections to a single port memory controller. The multi-port front end allows logic core and the HPS to share ports and thereby the available bandwidth of the memory controller.
Flexible I/O sharing	An advanced I/O pin muxing scheme allows improved sharing of I/O between the HPS and the core logic. The following types of I/O are available for SoC: • 17 dedicated I/Os—physically located inside the HPS block and are not accessible to logic within the core. The 17 dedicated I/Os are used for HPS clock, resets, and interfacing with boot devices, QSPI, and SD/MMC. • 48 direct shared I/O—located closest to the HPS block and are ideal for high speed HPS peripherals such as EMAC, USB, and others. There is one bank of 48 I/Os that supports direct sharing where the 48 I/Os can be shared 12 I/Os at a time. • Standard (shared) I/O—all standard I/Os can be shared by the HPS peripherals and any logic within the core. For designs where more than 48 I/Os are required to fully use all the peripherals in the HPS, these I/Os can be connected through the core logic.
EMAC core	Three EMAC cores are available in the HPS. The EMAC cores enable an application to support two redundant Ethernet connections; for example, backplane, or two EMAC cores for managing IEEE 1588 time stamp information while allowing a third EMAC core for debug and configuration. All three EMACs can potentially share the same time stamps, simplifying the 1588 time stamping implementation. A new serial time stamp interface allows core logic to access and read the time stamp values. The integrated EMAC controllers can be connected to external Ethernet PHY through the provided MDIO or I ² C interface.
On-chip memory	The on-chip memory is updated to 256 KB support and can support larger data sets and real time algorithms.
ECC enhancements	Improvements in L2 Cache ECC management allow identification of errors down to the address level. ECC enhancements also enable improved error injection and status reporting via the introduction of new memory mapped access to syndrome and data signals.
HPS to FPGA Interconnect Backbone	Although the HPS and the Logic Core can operate independently, they are tightly coupled via a high-bandwidth system interconnect built from high-performance ARM AMBA AXI bus bridges. IP bus masters in the FPGA fabric have access to HPS bus slaves via the FPGA-to-HPS interconnect. Similarly, HPS bus masters have access to bus slaves in the core fabric via the HPS-to-FPGA bridge. Both bridges are AMBA AXI-3 compliant and support simultaneous read and write transactions. Up to three masters within the core fabric can share the HPS SDRAM controller with the processor. Additionally, the processor can be used to configure the core fabric under program control via a dedicated 32-bit configuration port.
FPGA configuration and HPS booting	The FPGA fabric and HPS in the SoCs are powered independently. You can reduce the clock frequencies or gate the clocks to reduce dynamic power. You can configure the FPGA fabric and boot the HPS independently, in any order, providing you with more design flexibility.
Security	New security features have been introduced for anti-tamper management, secure boot, encryption (AES), and authentication (SHA).

Features of the HPS

The HPS has the following features:

- 1.2-GHz, dual-core ARM Cortex-A9 MPCore processor with up to 1.5-GHz via overdrive
 - ARMv7-A architecture that runs 32-bit ARM instructions, 16-bit and 32-bit Thumb instructions, and 8-bit Java byte codes in Jazelle style
 - Superscalar, variable length, out-of-order pipeline with dynamic branch prediction
 - Instruction Efficiency 2.5 MIPS/MHz, which provides total performance of 7500 MIPS at 1.5 GHz
- Each processor core includes:
 - 32 KB of L1 instruction cache, 32 KB of L1 data cache
 - Single- and double-precision floating-point unit and NEON media engine
 - CoreSight debug and trace technology
 - Snoop Control Unit (SCU) and Acceleration Coherency Port (ACP)
- 512 KB of shared L2 cache
- 256 KB of scratch RAM
- Hard memory controller with support for DDR3, DDR4 and optional error correction code (ECC) support
- Multiport Front End (MPFE) Scheduler interface to the hard memory controller
- 8-channel direct memory access (DMA) controller
- QSPI flash controller with SIO, DIO, QIO SPI Flash support
- NAND flash controller (ONFI 1.0 or later) with DMA and ECC support, updated to support 8 and 16-bit Flash devices and new command DMA to offload CPU for fast power down recovery
- Updated SD/SDIO/MMC controller to eMMC 4.5 with DMA with CE-ATA digital command support
- 3 10/100/1000 Ethernet media access control (MAC) with DMA
- 2 USB On-the-Go (OTG) controllers with DMA
- 5 I²C controllers (3 can be used by EMAC for MIO to external PHY)
- 2 UART 16550 Compatible controllers
- 4 serial peripheral interfaces (SPI) (2 Master, 2 Slaves)
- 62 programmable general-purpose I/Os, which includes 48 direct share I/Os that allows the HPS peripherals to connect directly to the FPGA I/Os
- 7 general-purpose timers
- 4 watchdog timers
- Anti-tamper, Secure Boot, Encryption (AES) and Authentication (SHA)

FPGA Configuration and HPS Booting

The FPGA fabric and HPS in the SoC FPGA must be powered at the same time. You can reduce the clock frequencies or gate the clocks to reduce dynamic power.

Once powered, the FPGA fabric and HPS can be configured independently thus providing you with more design flexibility:

- You can boot the HPS independently. After the HPS is running, the HPS can fully or partially reconfigure the FPGA fabric at any time under software control. The HPS can also configure other FPGAs on the board through the FPGA configuration controller.
- Configure the FPGA fabric first, and then boot the HPS from memory accessible to the FPGA fabric.

Hardware and Software Development

For hardware development, you can configure the HPS and connect your soft logic in the FPGA fabric to the HPS interfaces using the Platform Designer system integration tool in the Intel Quartus Prime software.

For software development, the ARM-based SoC FPGA devices inherit the rich software development ecosystem available for the ARM Cortex-A9 MPCore processor. The software development process for Intel SoC FPGAs follows the same steps as those for other SoC devices from other manufacturers. Support for Linux*, VxWorks*, and other operating systems are available for the SoC FPGAs. For more information on the operating systems support availability, contact the Intel FPGA sales team.

You can begin device-specific firmware and software development on the Intel SoC FPGA Virtual Target. The Virtual Target is a fast PC-based functional simulation of a target development system—a model of a complete development board. The Virtual Target enables the development of device-specific production software that can run unmodified on actual hardware.

Dynamic and Partial Reconfiguration

The Intel Arria 10 devices support dynamic and partial reconfiguration. You can use dynamic and partial reconfiguration simultaneously to enable seamless reconfiguration of both the device core and transceivers.

Dynamic Reconfiguration

You can reconfigure the PMA and PCS blocks while the device continues to operate. This feature allows you to change the data rates, protocol, and analog settings of a channel in a transceiver bank without affecting on-going data transfer in other transceiver banks. This feature is ideal for applications that require dynamic multiprotocol or multirate support.

Partial Reconfiguration

Using partial reconfiguration, you can reconfigure some parts of the device while keeping the device in operation.

The optional power reduction techniques in Intel Arria 10 devices include:

- **SmartVID**—a code is programmed into each device during manufacturing that allows a smart regulator to operate the device at lower core V_{CC} while maintaining performance
- **Programmable Power Technology**—non-critical timing paths are identified by the Intel Quartus Prime software and the logic in these paths is biased for low power instead of high performance
- **Low Static Power Options**—devices are available with either standard static power or low static power while maintaining performance

Furthermore, Intel Arria 10 devices feature Intel's industry-leading low power transceivers and include a number of hard IP blocks that not only reduce logic resources but also deliver substantial power savings compared to soft implementations. In general, hard IP blocks consume up to 90% less power than the equivalent soft logic implementations.

Incremental Compilation

The Intel Quartus Prime software incremental compilation feature reduces compilation time and helps preserve performance to ease timing closure. The incremental compilation feature enables the partial reconfiguration flow for Intel Arria 10 devices.

Incremental compilation supports top-down, bottom-up, and team-based design flows. This feature facilitates modular, hierarchical, and team-based design flows where different designers compile their respective design sections in parallel. Furthermore, different designers or IP providers can develop and optimize different blocks of the design independently. These blocks can then be imported into the top level project.

Document Revision History for Intel Arria 10 Device Overview

Document Version	Changes
2018.04.09	Updated the lowest V_{CC} from 0.83 V to 0.82 V in the topic listing a summary of the device features.

Date	Version	Changes
January 2018	2018.01.17	• Updated the maximum data rate for HPS (Intel Arria 10 SX devices external memory interface DDR3 controller from 2,166 Mbps to 2,133 Mbps. • Updated maximum frequency supported for half rate QDR II and QDR II + SRAM to 633 MHz in <i>Memory Standards Supported by the Soft Memory Controller</i> table. • Updated transceiver backplane capability to 12.5 Gbps. • Removed transceiver speed grade 5 in <i>Sample Ordering Core and Available Options for Intel Arria 10 GX Devices</i> figure.
continued...		

Date	Version	Changes
		- Removed package code 40, low static power, SmartVID, industrial, and military operating temperature support from <i>Sample Ordering Core and Available Options for Intel Arria 10 GT Devices</i> figure. - Updated short reach transceiver rate for Intel Arria 10 GT devices to 25.8 Gbps. - Removed On-Die Instrumentation — EyeQ and Jitter Margin Tool support from <i>PMA Features of the Transceivers in Intel Arria 10 Devices</i> table.
September 2017	2017.09.20	Updated the maximum speed of the DDR4 external memory interface from 1,333 MHz/2,666 Mbps to 1,200 MHz/2,400 Mbps.
July 2017	2017.07.13	Corrected the automotive temperature range in the figure showing the available options for the Intel Arria 10 GX devices from "-40°C to 100°C" to "-40°C to 125°C".
July 2017	2017.07.06	Added automotive temperature option to Intel Arria 10 GX device family.
May 2017	2017.05.08	- Corrected protocol names with "1588" to "IEEE 1588v2". - Updated the vertical migration table to remove vertical migration between Intel Arria 10 GX and Intel Arria 10 SX device variants. - Removed all "Preliminary" marks.
March 2017	2017.03.15	- Removed the topic about migration from Intel Arria 10 to Intel Stratix 10 devices. - Rebranded as Intel.
October 2016	2016.10.31	- Removed package F36 from Intel Arria 10 GX devices. - Updated Intel Arria 10 GT sample ordering code and maximum GX transceiver count. Intel Arria 10 GT devices are available only in the SF45 package option with a maximum of 72 transceivers.
May 2016	2016.05.02	- Updated the FPGA Configuration and HPS Booting topic. - Remove V_{CC} PowerManager from the Summary of Features, Power Management and Arria 10 Device Variants and packages topics. This feature is no longer supported in Arria 10 devices. - Removed LPDDR3 from the Memory Standards Supported by the HPS Hard Memory Controller table in the Memory Standards Supported by Intel Arria 10 Devices topic. This standard is only supported by the FPGA. - Removed transceiver speed grade 5 from the Device Variants and Packages topic for Arria 10 GX and SX devices.
February 2016	2016.02.11	- Changed the maximum Arria 10 GT datarate to 25.8 Gbps and the minimum datarate to 1 Gbps globally. - Revised the state for Core clock networks in the Summary of Features topic. - Changed the transceiver parameters in the "Summary of Features for Arria 10 Devices" table. - Changed the transceiver parameters in the "Maximum Resource Counts for Arria 10 GT Devices" table. - Changed the package availability for GT devices in the "Package Plan for Arria 10 GT Devices" table. - Changed the package configurations for GT devices in the "Migration Capability Across Arria 10 Product Lines" figure. - Changed transceiver parameters in the "Low Power Serial Transceivers" section. - Changed the transceiver descriptions in the "Device Variants for the Arria 10 Device Family" table. - Changed the "Sample Ordering Code and Available Options for Arria 10 GT Devices" figure. - Changed the datarates for GT devices in the "PMA Features" section. - Changed the datarates for GT devices in the "PCS Features" section.
continued...		

Date	Version	Changes
August 2014	2014.08.18	- Updated Memory (Kb) M20K maximum resources for Arria 10 GX 660 devices from 42,660 to 42,620. - Added GPIO columns consisting of LVDS I/O Bank and 3V I/O Bank in the Package Plan table. - Added how to use memory interface clock frequency higher than 533 MHz in the I/O vertical migration. - Added information to clarify that RLDRAM3 support uses hard PHY with soft memory controller. - Added variable precision DSP blocks support for floating-point arithmetic.
June 2014	2014.06.19	Updated number of dedicated I/Os in the HPS block to 17.
February 2014	2014.02.21	Updated transceiver speed grade options for GT devices in Figure 2.
February 2014	2014.02.06	Updated data rate for Arria 10 GT devices from 28.1 Gbps to 28.3 Gbps.
December 2013	2013.12.10	- Updated the HPS memory standards support from LPDDR2 to LPDDR3. - Updated HPS block diagram to include dedicated HPS I/O and FPGA Configuration blocks as well as repositioned SD/SDIO/MMC, DMA, SPI and NAND Flash with ECC blocks .
December 2013	2013.12.02	Initial release.
