

Welcome to [E-XFL.COM](https://www.e-xfl.com)

### What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

### Applications of "[Embedded - Microcontrollers](#)"

#### Details

|                            |                                                                                                                                                                             |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Product Status             | Obsolete                                                                                                                                                                    |

**Notes:**

AC characteristic in CLK synchronized mode.

C<sub>L</sub> is the load capacitance applied to pins during testing.

The maximum baud rate is limited by internal operation clock used and other parameters. Please use ch.3 and ch.4 with maximum baud rate 400kbps or less.

See Hardware Manual for details.

• Internal shift clock mode

• External shift clock mode

\*: It writes in the TDR register and, then, it changes.

| Parameter                       | Symbol               | Pin name                | Value          |     | Unit | Remarks                                                                                                                                                                                                                                                                                                                                                                                             |

\*1: Please use it with external load capacity 12pF or less for VCC=3.3V±0.3V (40MHz operation).

\*2: If the bus is expanded by automatic wait insertion or RDY input, add time ( $t_{CYC} \times$  the number of expanded cycles) to the rated value.

External bus I/F (synchronous mode, write operation, and multiplex mode) timing

External bus I/F (synchronous mode, write operation, and split mode) timing

Timing diagram for the external bus in read/write operation and multiplex mode. The diagram shows signals: SYSCLK, ASX, CS0X to CS3X, WR0X to WR1X, and D16 to D31. Time intervals are marked: t1, t2, t3, t4. Specific timing parameters are labeled: t<sub>cyc</sub>, tMASASH, tMASAH, tDSWH, tWHDH. Signal levels are indicated: ASCY=0, ACS=0, CSWR=2, WWT=0, ADCY=1, WRCS=1. The data bus is labeled 'Valid Address' and 'Write Data'.

External bus in asynchronous mode, write operation, and (chip mode) timing

The diagram illustrates the timing for a write operation in asynchronous mode. The signals shown are:

- SYSCLK**: System clock signal.
- ASX**: Address strobe signal.
- CS0X to CS3X**: Chip select signals.
- WR0X to WR1X**: Write enable signals.
- A00 to A21**: Address bus.
- D16 to D31**: Data bus.

Key timing parameters and conditions are indicated:

- $t_{cvc}$ : Critical path delay from clock to output.
- $ACS=0$ : Address valid time.
- $WRCs=1$ : Write enable pulse width.
- $CSWR=0$ ,  $WWT=0$ : Chip select and write enable setup times.
- Valid Address**: Address valid during the write operation.
- $t_{ASWH}$ : Address setup time before write enable.
- $t_{WHAH}$ : Address hold time after write enable.
- Write Data**: Data valid during the write operation.
- $t_{DSWH}$ : Data setup time before write enable.
- $t_{WHDH}$ : Data hold time after write enable.

### ■ Workaround

It is necessary to satisfy the below both conditions of (1) and (2).

- (1) Interrupt levels that are used as sources for recovering from the watch mode (power off) are '31', before CPU state changes to the watch mode (power off)
- (2) Don't use NMIX pin as source for recovering from the watch mode (power off)

### ■ Fix Status

Will not be planned

| Page                  | Section                                                                                                                                                          | Change Results                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
