

Welcome to **E-XFL.COM** 

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "<u>Embedded - Microcontrollers</u>"

| Details                    |  |
|----------------------------|--|
| Product Status             | Obsolete   |
| Core Processor             | FR81S  |
| Core Size                  | 32-Bit Single-Core   |
| Speed                      | 80MHz  |
| Connectivity               | CANbus, CSIO, EBI/EMI, I <sup>2</sup> C, LINbus, SPI, UART/USART                 |
| Peripherals                | DMA, LVD, POR, PWM, WDT  |
| Number of I/O              | 152  |
| Program Memory Size        | 1.0625MB (1.0625M x 8)   |
| Program Memory Type        | FLASH  |
| EEPROM Size                | 64K x 8  |
| RAM Size                   | 136K x 8   |
| Voltage - Supply (Vcc/Vdd) | 2.7V ~ 5.5V  |
| Data Converters            | A/D 48x12b; D/A 2x8b   |
| Oscillator Type            | External   |
| Operating Temperature      | -40°C ~ 105°C (TA)   |
| Mounting Type              | Surface Mount  |
| Package / Case             | 176-LQFP   |
| Supplier Device Package    | 176-LQFP (24x24)   |

| CR oscillator                                      |  |            | Yes              |            |             |  |
| NMI request function                               | Yes                                    |            |                  |            |             |  |
| OCD (On Chip Debug)                                |  |            | Yes              |            |             |  |
| TPU (Timing Protection Unit)                       |  |            | Yes              |            |             |  |
| Key code register                                  |  |            | Yes              |            |             |  |
| Waveform generator                                 |  |            | 6ch              |            |             |  |
| Operation guaranteed temperature (T <sub>A</sub> ) |  |            | -40°C to +125°   |            |             |  |
| Power supply                                       |  |            | 2.7V to 5.5V *2  | <u>-</u>   |             |  |
| Package  | LQM120                                 |            |                  |            |             |  |

<sup>\*1:</sup> Only channel 3 and channel 4 support the I<sup>2</sup>C (fast mode/standard mode).

Only channel 5, channel 6, channel 7, channel 8 and channel 11 support the I<sup>2</sup>C (standard mode).

<sup>\*2:</sup> The initial detection voltage of the external low voltage detection is 2.8V±8% (2.576V to 3.024V). This LVD setting and internal LVD cannot be used to reliably generate a reset before voltage dips below minimum guaranteed operation voltage, as these detection levels are below the minimum guaranteed MCU operation voltage. Below the minimum guaranteed MCU operation voltage, MCU operations are not guaranteed with the exception of LVD.

### ■ Observance of Safety Regulations and Standards

Most countries in the world have established standards and regulations regarding safety, protection from electromagnetic interference, etc. Customers are requested to observe applicable regulations and standards in the design of products.

## ■ Fail-Safe Design

Any semiconductor devices have inherently a certain rate of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

## ■ Precautions Related to Usage of Devices

Cypress semiconductor devices are intended for use in standard applications (computers, office automation and other office equipment, industrial, communications, and measurement equipment, personal or household devices, etc.).

**CAUTION:** Customers considering the use of our products in special applications where failure or abnormal operation may directly affect human lives or cause physical injury or property damage, or where extremely high levels of reliability are demanded (such as aerospace systems, atomic energy controls, sea floor repeaters, vehicle operating controls, medical devices for life support, etc.) are requested to consult with sales representatives before such use. The company will not be responsible for damages arising from such use without prior approval.

# 2. Precautions for Package Mounting

Package mounting may be either lead insertion type or surface mount type. In either case, for heat resistance during soldering, you should only mount under Cypress's recommended conditions. For detailed information about mount conditions, contact your sales representative.

### ■ Lead Insertion Type

Mounting of lead insertion type packages onto printed circuit boards may be done by two methods: direct soldering on the board, or mounting by using a socket.

Direct mounting onto boards normally involves processes for inserting leads into through-holes on the board and using the flow soldering (wave soldering) method of applying liquid solder. In this case, the soldering process usually causes leads to be subjected to thermal stress in excess of the absolute ratings for storage temperature. Mounting processes should conform to Cypress recommended mounting conditions.

If socket mounting is used, differences in surface treatment of the socket contacts and IC lead surfaces can lead to contact deterioration after long periods. For this reason it is recommended that the surface treatment of socket contacts and IC leads be verified before mounting.

### ■ Surface Mount Type

Surface mount packaging has longer and thinner leads than lead-insertion packaging, and therefore leads are more easily deformed or bent. The use of packages with higher pin counts and narrower pin pitch results in increased susceptibility to open connections caused by deformed pins, or shorting due to solder bridges.

You must use appropriate mounting techniques. Cypress recommends the solder reflow method, and has established a ranking of mounting conditions for each product. Users are advised to mount packages in accordance with Cypress ranking of recommended conditions.

# ■ Lead-Free Packaging

**CAUTION:** When ball grid array (BGA) packages with Sn-Ag-Cu balls are mounted using Sn-Pb eutectic soldering, junction strength may be reduced under some conditions of use.

**Note:** It does not support a DMA transfer request caused by an interrupt generated from a peripheral to which no RN (Resource Number) is assigned.

- \*1: It does not support a DMA transfer by the status of the multi-function serial interface and I<sup>2</sup>C reception.
- \*2: Reload timer ch.4 to ch.7 do not support a DMA transfer by the interrupt.
- \*3: PPG ch.24 to ch.47 do not support a DMA transfer by the interrupt.
- \*4: The clock calibration unit does not support a DMA transfer by the interrupt.
- \*5: 32-bit Free-run timer ch.3, ch.4 and ch.5 do not support a DMA transfer by the interrupt.
- \*6: There is no resource corresponding to the interrupt level.
- \*7: It does not support a DMA transfer by the external low-voltage detection interrupt.
- \*8: REALOS is a trademark of Cypress.

- \*8: It is a standard when four-layer substrate is used.
- \*9: Corresponding pins: General-purpose ports other than those of P103, P104, P105 and P106.
- \*10: Corresponding pins: General-purpose ports of P103, P104, P105 and P106.

### <WARNING>

Semiconductor devices may be permanently damaged by application of stress (including, without limitation, voltage, current or temperature) in excess of absolute maximum ratings. Do not exceed any of these ratings.

### Recommended operating conditions

 $(V_{SS}=AV_{SS}=0.0V)$

<sup>\*1:</sup> When it is used outside recommended operation guarantee range (range of the operation guarantee),contact your sales representative.

The initial detection voltage of the external low voltage detection is 2.8V±8% (2.576V to 3.024V). This LVD setting and internal LVD cannot be used to reliably generate a reset before voltage dips below minimum guaranteed operation voltage, as these detection levels are below the minimum guaranteed MCU operation voltage. Below the

### ■ Scope of Impact

For the affected parts, when the Power-On Reset and Internal Low Voltage Detection are not generated, the MCU may set invalid package and sub clock option information. Therefore, the MCU may operate with an invalid pin configuration.

#### ■ Workaround

For the affected parts, it is necessary to satisfy at least one of the Power-On Reset requirements for any Power-On event as given below:

- (1) The VCC voltage is less than 200 mV for 50 ms or longer (t<sub>OFF</sub>)
- (2) VCC Power ramp rate is less than 4 mV/µs (dV/dt) until a voltage level for a safe Power-On detection is reached
- (3) C-pin voltage is below 60 mV when VCC is turned on again

If the customer system does not satisfy the condition above-mentioned, Cypress will releases new version D, so Cypress recommends the version D for MB91F52x. The new version prevents the limitation when an external reset signal is asserted at pin RSTX anytime the supply voltage (VCC) is turned on.

### ■ Fix Status

Will be fixed in production silicon version D, E

## 2. Limitation for Watch mode (power off)

### ■ Problem Definition

If the below all trigger conditions (1) to (3) are satisfied, the below registers will be initialized after MCU recovers from watch mode (power off).

# **■ Trigger Conditions**

- (1) Using the watch mode (power off)
- (2) Interrupt levels that are used as sources for recovering from the watch mode (power off) are '16' to '30', or using NMIX pin as source for recovering from the watch mode (power off)
- (3) The sources for recovering from the watch mode (power off) are generated between PCLK 1 cycle and PMUCLK 3 cycles (\*), after CPU state changes to the watch mode (power off)
  (\*): In case of PCLK = 0.5 MHz and PMUCLK = 32 kHz, it is approx. 2 μs to 100 μs

# ■ Scope of Impact

If the all trigger conditions (1) to (3) are satisfied, the below registers will be initialized after MCU recovers from watch mode (power off).

| Page | Section                 | Change Results   |  |  |  |  |  |
|------|-------------------------|--|--|--|--|--|--|
| 131  | ■Interrupt Vector Table | "42" is deleted as shown below from the interrupt factor in Interrupt vector 120pin.  (Error)  PPG2/3/12/13/22 /23/32/33/42/43  16-bit free-run timer 2 (0 detection) / (compare clear)  (Correct)  PPG2/3/12/13/22 /23/32/33/43  16-bit free-run timer 2 (0 detection) / (compare clear)  41 29 ICR 358 H 000F FF58 H 25 H 000F FF58 H 25 H |  |  |  |  |  |
| 133  | ■Interrupt Vector Table | The interrupt factor in Interrupt vector 120pin modified as follows:  (Error)  Base timer 1 IRQ0 Base timer 1 IRQ1  (Correct)  Base timer 1 IRQ0 Base timer 1 IRQ1   |  |  |  |  |  |
| 133  | ■Interrupt Vector Table | The following sentence deleted from Interrupt vector 120pins.  (Error)  *5: It does not support the DMA transfer by the interrupt because of the RAM ECC bit error.  |  |  |  |  |  |
