What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	ARM® Cortex®-M0+
Core Size	32-Bit Single-Core
Speed	32MHz
Connectivity	I²C, IrDA, LINbus, SPI, UART/USART, USB
Peripherals	Brown-out Detect/Reset, DMA, I²S, LCD, POR, PWM, WDT
Number of I/O	84
Program Memory Size	128KB (128K x 8)
Program Memory Type	FLASH
EEPROM Size	3K x 8
RAM Size	20K x 8
Voltage - Supply (Vcc/Vdd)	1.8V ~ 3.6V
Data Converters	A/D 16x12b; D/A 2x12b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	100-LQFP
Supplier Device Package	100-LQFP (14x14)

3.16 Touch sensing controller (TSC)

The STM32L083xx provide a simple solution for adding capacitive sensing functionality to any application. These devices offer up to 24 capacitive sensing channels distributed over 8 analog I/O groups.

Capacitive sensing technology is able to detect the presence of a finger near a sensor which is protected from direct touch by a dielectric (such as glass, plastic). The capacitive variation introduced by the finger (or any conductive object) is measured using a proven implementation based on a surface charge transfer acquisition principle. It consists of charging the sensor capacitance and then transferring a part of the accumulated charges into a sampling capacitor until the voltage across this capacitor has reached a specific threshold. To limit the CPU bandwidth usage, this acquisition is directly managed by the hardware touch sensing controller and only requires few external components to operate.

The touch sensing controller is fully supported by the STMTouch touch sensing firmware library, which is free to use and allows touch sensing functionality to be implemented reliably in the end application.

3.17 AES

The AES Hardware Accelerator can be used to encrypt and decrypt data using the AES algorithm (compatible with FIPS PUB 197, 2001 Nov 26).

- Key scheduler
- Key derivation for decryption
- 128-bit data block processed
- 128-bit key length
- 213 clock cycles to encrypt/decrypt one 128-bit block
- Electronic codebook (ECB), cypher block chaining (CBC), and counter mode (CTR) supported by hardware.

The AES can be served by the DMA controller.

3.18 Timers and watchdogs

The ultra-low-power STM32L083xx devices include three general-purpose timers, one low-power timer (LPTIM), one basic timer, two watchdog timers and the SysTick timer.

Table 10 compares the features of the general-purpose and basic timers.

Table 10. Timer feature comparison

Timer	Counter resolution	Counter type	Prescaler factor	DMA request generation	Capture/compare channels	Complementary outputs
TIM2, TIM3	16-bit	Up, down, up/down	Any integer between 1 and 65536	Yes	4	No
TIM21, TIM22	16-bit	Up, down, up/down	Any integer between 1 and 65536	No	2	No
TIM6, TIM7	16-bit	Up	Any integer between 1 and 65536	Yes	0	No

3.18.1 General-purpose timers (TIM2, TIM3, TIM21 and TIM22)

There are four synchronizable general-purpose timers embedded in the STM32L083xx device (see *Table 10* for differences).

TIM2, TIM3

TIM2 and TIM3 are based on 16-bit auto-reload up/down counter. It includes a 16-bit prescaler. It features four independent channels each for input capture/output compare, PWM or one-pulse mode output.

The TIM2/TIM3 general-purpose timers can work together or with the TIM21 and TIM22 general-purpose timers via the Timer Link feature for synchronization or event chaining. Their counter can be frozen in debug mode. Any of the general-purpose timers can be used to generate PWM outputs.

TIM2/TIM3 have independent DMA request generation.

3.19.3 Low-power universal asynchronous receiver transmitter (LPUART)

The devices embed one Low-power UART. The LPUART supports asynchronous serial communication with minimum power consumption. It supports half duplex single wire communication and modem operations (CTS/RTS). It allows multiprocessor communication.

The LPUART has a clock domain independent from the CPU clock. It can wake up the system from Stop mode using baudrates up to 46 Kbaud. The Wakeup events from Stop mode are programmable and can be:

- Start bit detection
- Or any received data frame
- Or a specific programmed data frame

Only a 32.768 kHz clock (LSE) is needed to allow LPUART communication up to 9600 baud. Therefore, even in Stop mode, the LPUART can wait for an incoming frame while having an extremely low energy consumption. Higher speed clock can be used to reach higher baudrates.

LPUART interface can be served by the DMA controller.

3.19.4 Serial peripheral interface (SPI)/Inter-integrated sound (I2S)

Up to two SPIs are able to communicate at up to 16 Mbits/s in slave and master modes in full-duplex and half-duplex communication modes. The 3-bit prescaler gives 8 master mode frequencies and the frame is configurable to 8 bits or 16 bits. The hardware CRC generation/verification supports basic SD Card/MMC modes.

The USARTs with synchronous capability can also be used as SPI master.

One standard I2S interfaces (multiplexed with SPI2) is available. It can operate in master or slave mode, and can be configured to operate with a 16-/32-bit resolution as input or output channels. Audio sampling frequencies from 8 kHz up to 192 kHz are supported. When the I2S interfaces is configured in master mode, the master clock can be output to the external DAC/CODEC at 256 times the sampling frequency.

The SPIs can be served by the DMA controller.

Refer to *Table 14* for the differences between SPI1 and SPI2.

	Junction temperature range (range 3)	-40 °C ≤ T_A ≤ 125 °C	–40	130	

1. It is recommended to power V_{DD} and V_{DDA} from the same source. A maximum difference of 300 mV between V_{DD} and V_{DDA} can be tolerated during power-up and normal operation.
2. V_{DD_USB} must respect the following conditions:

- When V_{DD} is powered on (V_{DD} < V_{DD_min}), V_{DD_USB} should be always lower than V_{DD}.
- When V_{DD} is powered down (V_{DD} < V_{DD_min}), V_{DD_USB} should be always lower than V_{DD}.
- In operating mode, V_{DD_USB} could be lower or higher V_{DD}.
- If the USB is not used, V_{DD_USB} must range from V_{DD_min} to V_{DD_max} to be able to use PA11 and PA12 as standard I/Os.

3. To sustain a voltage higher than V_{DD}+0.3V, the internal pull-up/pull-down resistors must be disabled.
4. If T_A is lower, higher P_D values are allowed as long as T_J does not exceed T_J max (see *Table 90: Thermal characteristics on page 134*).

1. The I_{IO} current sunk by the device must always respect the absolute maximum rating specified in *Table 24*. The sum of the currents sunk by all the I/Os (I/O ports and control pins) must always be respected and must not exceed $\Sigma I_{IO(PIN)}$.
2. TTL and CMOS outputs are compatible with JEDEC standards JESD36 and JESD52.
3. The I_{IO} current sourced by the device must always respect the absolute maximum rating specified in *Table 24*. The sum of the currents sourced by all the I/Os (I/O ports and control pins) must always be respected and must not exceed $\Sigma I_{IO(PIN)}$.
4. Guaranteed by characterization results.

Input/output AC characteristics

The definition and values of input/output AC characteristics are given in *Figure 26* and *Table 62*, respectively.

Unless otherwise specified, the parameters given in *Table 62* are derived from tests performed under ambient temperature and V_{DD} supply voltage conditions summarized in *Table 26*.

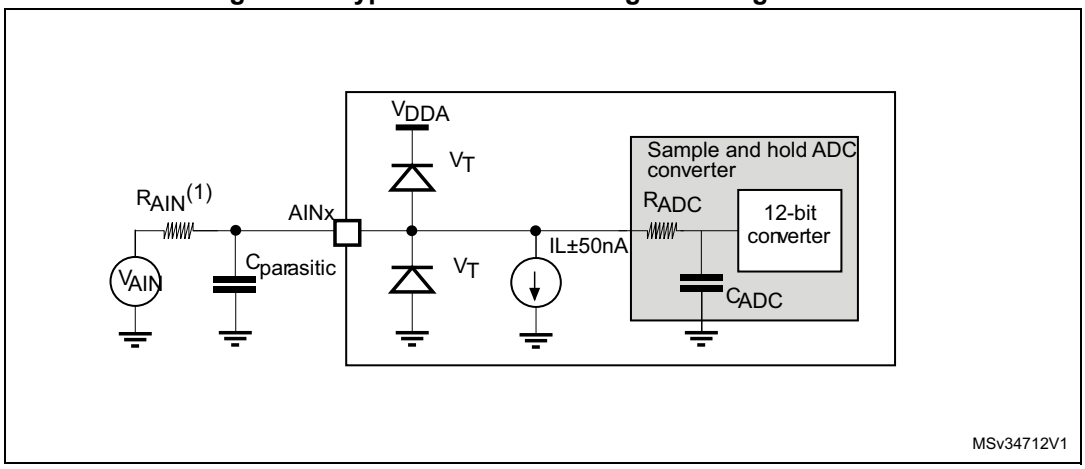
1. The I/O speed is configured using the OSPEEDRx[1:0] bits. Refer to the line reference manual for a description of GPIO Port configuration register.
2. Guaranteed by design.
3. The maximum frequency is defined in *Figure 26*.
4. When Fm+ configuration is set, the I/O speed control is bypassed. Refer to the line reference manual for a detailed description of Fm+ I/O configuration.

Figure 29. Typical connection diagram using the ADC

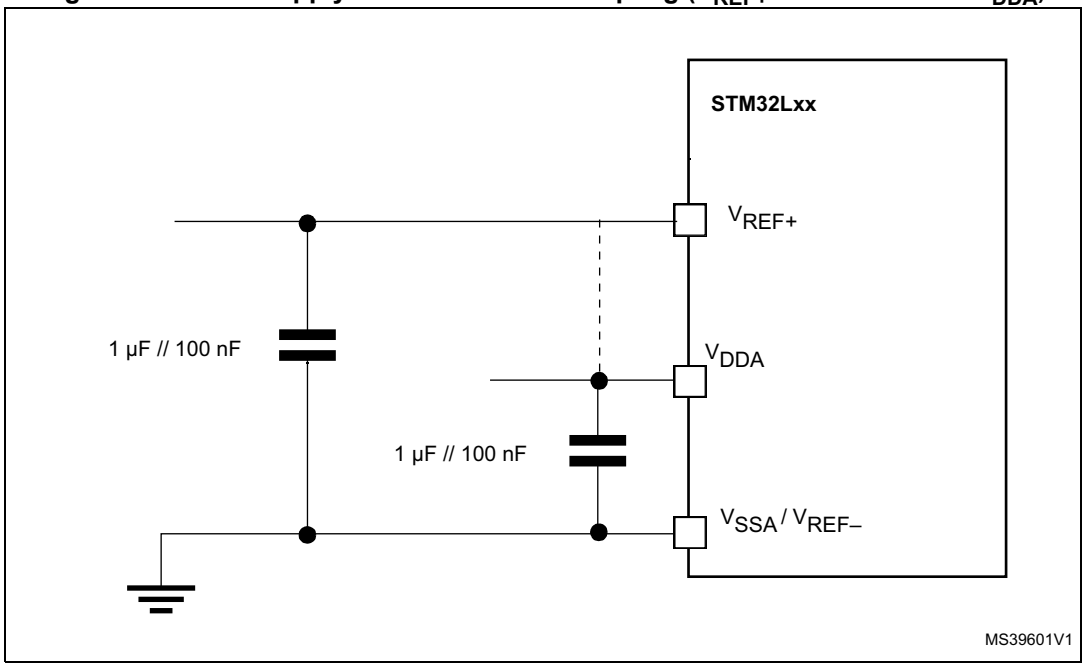


1. Refer to *Table 64: ADC characteristics* for the values of R_{AIN}, R_{ADC} and C_{ADC}.
2. $C_{parasitic}$ represents the capacitance of the PCB (dependent on soldering and PCB layout quality) plus the pad capacitance (roughly 7 pF). A high $C_{parasitic}$ value will downgrade conversion accuracy. To remedy this, f_{ADC} should be reduced.

General PCB design guidelines

Power supply decoupling should be performed as shown in *Figure 30* or *Figure 31*, depending on whether V_{REF+} is connected to V_{DDA} or not. The 10 nF capacitors should be ceramic (good quality). They should be placed as close as possible to the chip.

Figure 30. Power supply and reference decoupling (V_{REF+} not connected to V_{DDA})



The analog spike filter is compliant with I^2C timings requirements only for the following voltage ranges:

- Fast mode Plus: 2.7 V ≤ V_{DD} ≤ 3.6 V and voltage scaling Range 1
- Fast mode:
  - 2 V ≤ V_{DD} ≤ 3.6 V and voltage scaling Range 1 or Range 2.
  - V_{DD} < 2 V, voltage scaling Range 1 or Range 2, C_{load} < 200 pF.

In other ranges, the analog filter should be disabled. The digital filter can be used instead.

Note: In Standard mode, no spike filter is required.

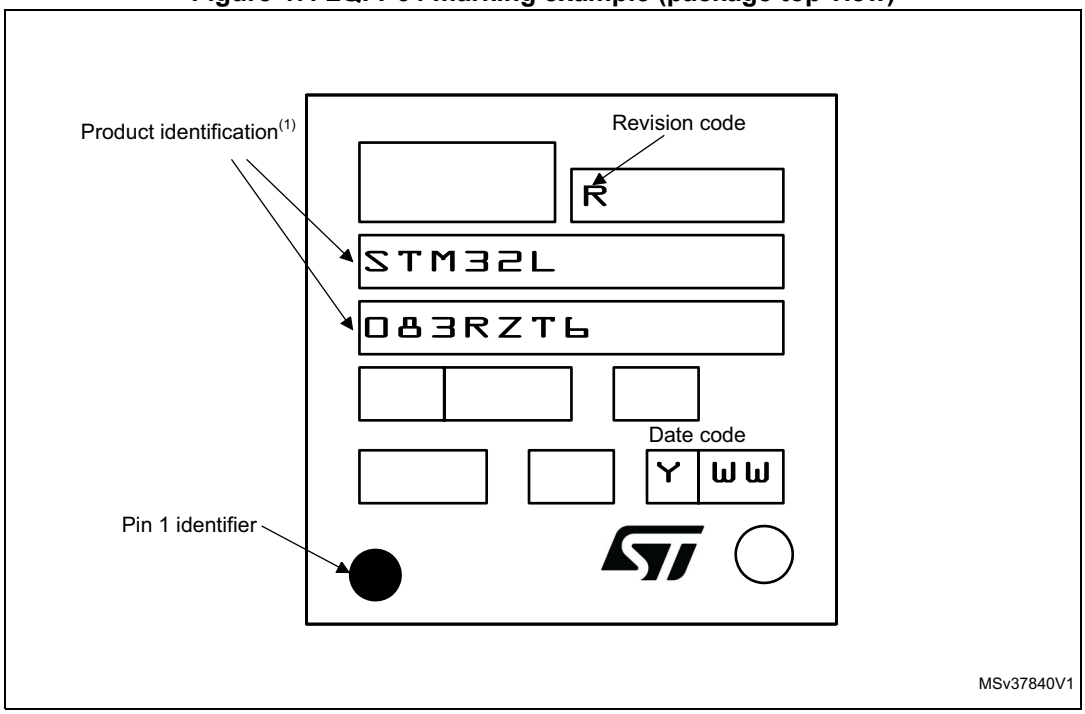
1. LCD enabled with 3 V internal step-up active, 1/8 duty, 1/4 bias, division ratio= 64, all pixels active, no LCD connected.
2. Guaranteed by design.
3. Guaranteed by characterization results.

Device marking for LQFP64

The following figure gives an example of topside marking versus pin 1 position identifier location.

Figure 47. LQFP64 marking example (package top view)



1. Parts marked as “ES”, “E” or accompanied by an Engineering Sample notification letter, are not yet qualified and therefore not yet ready to be used in production and any consequences deriving from such usage will not be at ST charge. In no event, ST will be liable for any customer usage of these engineering samples in production. ST Quality has to be contacted prior to any decision to use these Engineering samples to run qualification activity.

8 Part numbering

Table 91. STM32L083xx ordering information scheme

Example: STM32 L 083 R Z T 6 D TR

Device family

STM32 = ARM-based 32-bit microcontroller

Product type

L = Low power

Device subfamily

083 = USB + LCD + AES

Pin count

C = 48/49 pins

R = 64 pins

V = 100 pins

Flash memory size

8 = 64 Kbytes

B = 128 Kbytes

Z = 192 Kbytes

Package

T = LQFP

H = TFBGA

I = UFBGA

Temperature range

6 = Industrial temperature range, –40 to 85 °C

7 = Industrial temperature range, –40 to 105 °C

3 = Industrial temperature range, –40 to 125 °C

Options

No character = V_{DD} range: 1.8 to 3.6 V and BOR enabled

D = V_{DD} range: 1.65 to 3.6 V and BOR disabled

Packing

TR = tape and reel

No character = tray or tube

9 Revision history

Table 92. Document revision history

Date	Revision	Changes
03-Aug-2015	1	Initial release
26-Oct-2015	2	Added UFBGA100 package. Changed confidentiality level to public. Updated datasheet status to “production data”. Modified ultra-low-power platform features on cover page. Changed LCD_VLCD1 into LCD_VLCD2 in *Section 3.13.2: VLCD voltage monitoring*. In *Section 6: Electrical characteristics*, updated notes related to values guaranteed by characterization. Updated $\|\Delta V_{SS}\|$ definition to include V_{REF-} in *Table 23: Voltage characteristics*. Added ΣV_{DD_USB} and updated $\Sigma I_{IO(PIN)}$ in *Figure 24: Current characteristics*. Updated *Table 56: EMI characteristics*. Updated f_{TRIG} and V_{AIN} maximum value, added V_{REF+} and V_{REF-} in *Table 64: ADC characteristics*. Updated *Figure 53: LQFP48 marking example (package top view)*.

Table 92. Document revision history

Date	Revision	Changes
22-Mar-2016	3	Updated number of SPIs on cover page and in *Table 2: Ultra-low-power STM32L083xxx device features and peripheral counts*. Changed minimum comparator supply voltage to 1.65 V on cover page. Added minimum DAC supply voltage on cover page. Added number of fast and standard channels in *Section 3.12: Analog-to-digital converter (ADC)*. Updated *Section 3.19.2: Universal synchronous/asynchronous receiver transmitter (USART)* and *Section 3.19.4: Serial peripheral interface (SPI)/Inter-integrated sound (I2S)* to mention the fact that USARTs with synchronous mode feature can be used as SPI master interfaces. Added baudrate allowing to wake up the MCU from Stop mode in *Section 3.19.2: Universal synchronous/asynchronous receiver transmitter (USART)* and *Section 3.19.3: Low-power universal asynchronous receiver transmitter (LPUART)*. *Section 6.3.15: 12-bit ADC characteristics*: – *Table 64: ADC characteristics*: Distinction made between V_{DDA} for fast and standard channels; added note *1.* Added note *4.* related to R_{ADC}. Updated f_{TRIG}. Updated t_S and t_{CONV}. – Updated equation 1 description. – Updated *Table 65: RAIN max for fADC = 16 MHz* for f_{ADC} = 16 MHz and distinction made between fast and standard channels. Updated R_O and added Note *2.* in *Table 67: DAC characteristics*. Added *Table 74: USART/LPUART characteristics*.
