
Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Obsolete
Number of LABs/CLBs	768
Number of Logic Elements/Cells	-
Total RAM Bits	-
Number of I/O	81
Number of Gates	12000
Voltage - Supply	2.25V ~ 5.25V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 85°C (TA)
Package / Case	100-LQFP
Supplier Device Package	100-TQFP (14x14)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/a54sx08a-2tq100i

Logic Module Design

The SX-A family architecture is described as a "sea-of-modules" architecture because the entire floor of the device is covered with a grid of logic modules with virtually no chip area lost to interconnect elements or routing. The Actel SX-A family provides two types of logic modules: the register cell (R-cell) and the combinatorial cell (C-cell).

The R-cell contains a flip-flop featuring asynchronous clear, asynchronous preset, and clock enable, using the S0 and S1 lines control signals (Figure 1-2). The R-cell registers feature programmable clock polarity selectable on a register-by-register basis. This provides additional flexibility while allowing mapping of synthesized functions into the SX-A FPGA. The clock source for the R-cell can be chosen from either the hardwired clock, the routed clocks, or internal logic.

The C-cell implements a range of combinatorial functions of up to five inputs (Figure 1-3). Inclusion of the DB input and its associated inverter function allows up to 4,000 different combinatorial functions to be implemented in a single module. An example of the flexibility enabled by the inversion capability is the ability to integrate a 3-input exclusive-OR function into a single C-cell. This facilitates construction of 9-bit parity-tree functions with 1.9 ns propagation delays.

Module Organization

All C-cell and R-cell logic modules are arranged into horizontal banks called Clusters. There are two types of Clusters: Type 1 contains two C-cells and one R-cell, while Type 2 contains one C-cell and two R-cells.

Clusters are grouped together into SuperClusters (Figure 1-4 on page 1-3). SuperCluster 1 is a two-wide grouping of Type 1 Clusters. SuperCluster 2 is a two-wide group containing one Type 1 Cluster and one Type 2 Cluster. SX-A devices feature more SuperCluster 1 modules than SuperCluster 2 modules because designers typically require significantly more combinatorial logic than flip-flops.

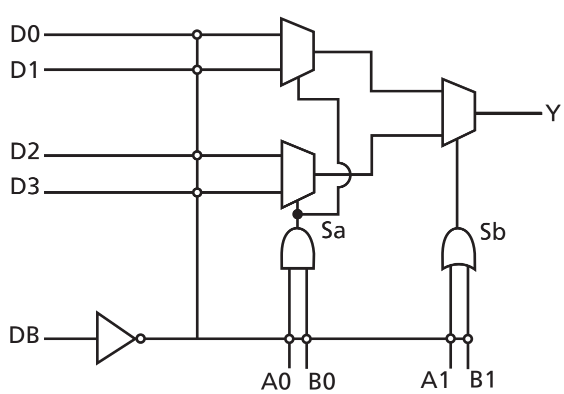

Figure 1-3 • **C-Cell**

SX-A Probe Circuit Control Pins

SX-A devices contain internal probing circuitry that provides built-in access to every node in a design, enabling 100% real-time observation and analysis of a device's internal logic nodes without design iteration. The probe circuitry is accessed by Silicon Explorer II, an easy to use, integrated verification and logic analysis tool that can sample data at 100 MHz (asynchronous) or 66 MHz (synchronous). Silicon Explorer II attaches to a PC's standard COM port, turning the PC into a fully functional 18-channel logic analyzer. Silicon Explorer II allows designers to complete the design verification process at their desks and reduces verification time from several hours per cycle to a few seconds.

The Silicon Explorer II tool uses the boundary-scan ports (TDI, TCK, TMS, and TDO) to select the desired nets for verification. The selected internal nets are assigned to the PRA/PRB pins for observation. Figure 1-13 illustrates the interconnection between Silicon Explorer II and the FPGA to perform in-circuit verification.

Design Considerations

In order to preserve device probing capabilities, users should avoid using the TDI, TCK, TDO, PRA, and PRB pins as input or bidirectional ports. Since these pins are active during probing, critical input signals through these pins are not available. In addition, the security fuse must not be programmed to preserve probing capabilities. Actel recommends that you use a 70 Ω series termination resistor on every probe connector (TDI, TCK, TMS, TDO, PRA, PRB). The 70 Ω series termination is used to prevent data transmission corruption during probing and reading back the checksum.

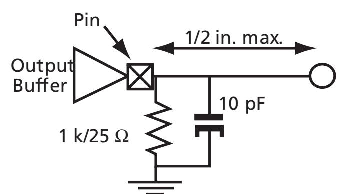
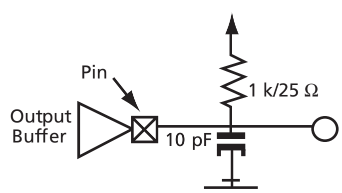
Table 2-10 • **AC Specifications (3.3 V PCI Operation)**

Symbol	Parameter	Condition	Min.	Max.	Units
$I_{OH(AC)}$	Switching Current High	$0 < V_{OUT} \leq 0.3V_{CCI}$ [1]	$-12V_{CCI}$	–	mA
		$0.3V_{CCI} \leq V_{OUT} < 0.9V_{CCI}$ [1]	$(-17.1(V_{CCI} - V_{OUT}))$	–	mA
		$0.7V_{CCI} < V_{OUT} < V_{CCI}$ [1, 2]	–	EQ 2-3 on page 2-7	–
	(Test Point)	$V_{OUT} = 0.7V_{CC}$ [2]	–	$-32V_{CCI}$	mA
$I_{OL(AC)}$	Switching Current Low	$V_{CCI} > V_{OUT} \geq 0.6V_{CCI}$ [1]	$16V_{CCI}$	–	mA
		$0.6V_{CCI} > V_{OUT} > 0.1V_{CCI}$ [1]	$(26.7V_{OUT})$	–	mA
		$0.18V_{CCI} > V_{OUT} > 0$ [1, 2]	–	EQ 2-4 on page 2-7	–
	(Test Point)	$V_{OUT} = 0.18V_{CC}$ [2]	–	$38V_{CCI}$	mA
I_{CL}	Low Clamp Current	$-3 < V_{IN} \leq -1$	$-25 + (V_{IN} + 1)/0.015$	–	mA
I_{CH}	High Clamp Current	$V_{CCI} + 4 > V_{IN} \geq V_{CCI} + 1$	$25 + (V_{IN} - V_{CCI} - 1)/0.015$	–	mA
$slew_R$	Output Rise Slew Rate	$0.2V_{CCI}$ - $0.6V_{CCI}$ load [3]	1	4	V/ns
$slew_F$	Output Fall Slew Rate	$0.6V_{CCI}$ - $0.2V_{CCI}$ load [3]	1	4	V/ns

Notes:

1. *Refer to the V/I curves in Figure 2-2 on page 2-7. Switching current characteristics for REQ# and GNT# are permitted to be one half of that specified here; i.e., half size output drivers may be used on these signals. This specification does not apply to CLK and RST#, which are system outputs. "Switching Current High" specifications are not relevant to SERR#, INTA#, INTB#, INTC#, and INTD#, which are open drain outputs.*
2. *Maximum current requirements must be met as drivers pull beyond the last step voltage. Equations defining these maximums (C and D) are provided with the respective diagrams in Figure 2-2 on page 2-7. The equation defined maximum should be met by design. In order to facilitate component testing, a maximum current test point is defined for each side of the output driver.*
3. *This parameter is to be interpreted as the cumulative edge rate across the specified range, rather than the instantaneous rate at any point within the transition range. The specified load (diagram below) is optional; i.e., the designer may elect to meet this parameter with an unloaded output per the latest revision of the PCI Local Bus Specification. However, adherence to both maximum and minimum parameters is required (the maximum is no longer simply a guideline). Rise slew rate does not apply to open drain outputs.*





Input Buffer Delays

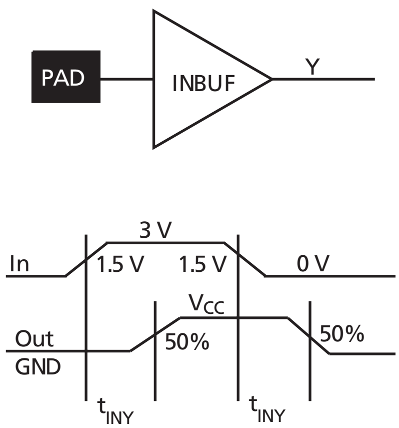


Figure 2-6 • **Input Buffer Delays**

C-Cell Delays

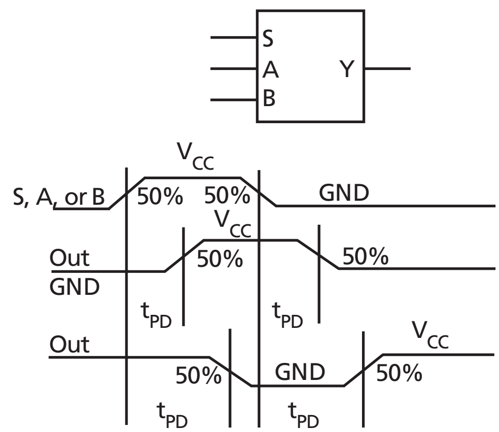

Figure 2-7 • **C-Cell Delays**

Cell Timing Characteristics

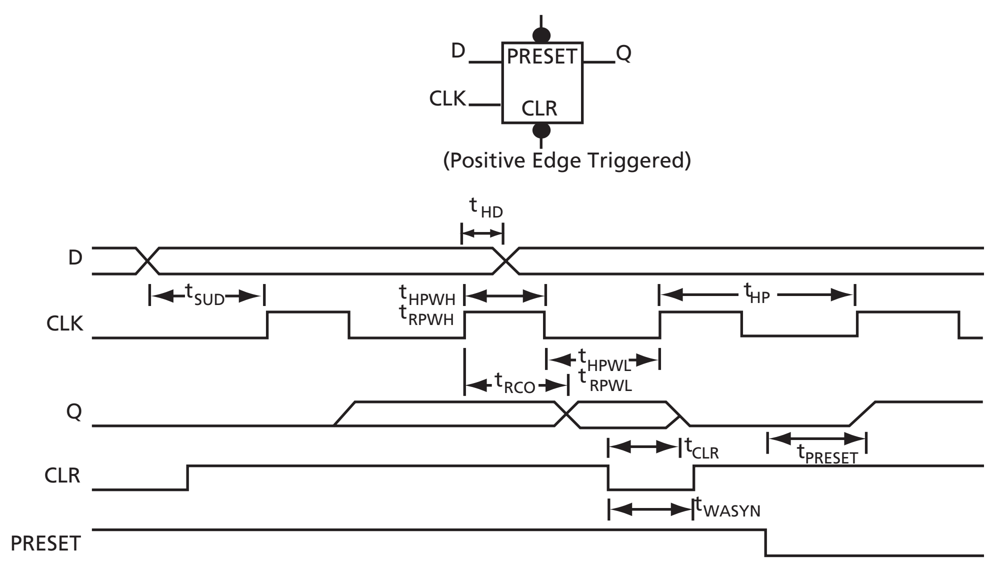

Figure 2-8 • **Flip-Flops**

Timing Characteristics

Timing characteristics for SX-A devices fall into three categories: family-dependent, device-dependent, and design-dependent. The input and output buffer characteristics are common to all SX-A family members. Internal routing delays are device-dependent. Design dependency means actual delays are not determined until after placement and routing of the user's design are complete. The timing characteristics listed in this datasheet represent sample timing numbers of the SX-A devices. Design-specific delay values may be determined by using Timer or performing simulation after successful place-and-route with the Designer software.

Critical Nets and Typical Nets

Propagation delays are expressed only for typical nets, which are used for initial design performance evaluation. Critical net delays can then be applied to the most timing-critical paths. Critical nets are determined by net property assignment prior to placement and routing. Up to 6 percent of the nets in a design may be designated as critical, while 90 percent of the nets in a design are typical.

Long Tracks

Some nets in the design use long tracks. Long tracks are special routing resources that span multiple rows, columns, or modules. Long tracks employ three to five antifuse connections. This increases capacitance and resistance, resulting in longer net delays for macros connected to long tracks. Typically, up to 6 percent of nets in a fully utilized device require long tracks. Long tracks contribute approximately 4 ns to 8.4 ns delay. This additional delay is represented statistically in higher fanout routing delays.

Timing Derating

SX-A devices are manufactured with a CMOS process. Therefore, device performance varies according to temperature, voltage, and process changes. Minimum timing parameters reflect maximum operating voltage, minimum operating temperature, and best-case processing. Maximum timing parameters reflect minimum operating voltage, maximum operating temperature, and worst-case processing.

Temperature and Voltage Derating Factors

Table 2-13 • **Temperature and Voltage Derating Factors (Normalized to Worst-Case Commercial, T_J = 70°C, V_{CCA} = 2.25 V)**

V_{CCA}	Junction Temperature (T_J)						
	–55°C	–40°C	0°C	25°C	70°C	85°C	125°C
2.250 V	0.79	0.80	0.87	0.89	1.00	1.04	1.14
2.500 V	0.74	0.75	0.82	0.83	0.94	0.97	1.07
2.750 V	0.68	0.69	0.75	0.77	0.87	0.90	0.99

d_{THLS}[4]	Delta High to Low—low slew		0.057		0.06		0.071		0.086		0.117	ns/pF

Note:

1. *All –3 speed grades have been discontinued.*
2. *Delays based on 35 pF loading.*
3. *The equivalent IO Attribute settings for 2.5 V LVCMOS is 2.5 V LVTTL in the software.*
4. *To obtain the slew rate, substitute the appropriate Delta value, load capacitance, and the V_{CCI} value into the following equation:*
   Slew Rate [V/ns] = $(0.1*V_{CCI} – 0.9*V_{CCI})/ (C_{load} * d_{T[LH|HL|HLS]})$
   where C_{load} is the load capacitance driven by the I/O in pF
   $d_{T[LH|HL|HLS]}$ is the worst case delta value from the datasheet in ns/pF.

Table 2-35 • **A54SX72A Timing Characteristics (Continued)**
(Worst-Case Commercial Conditions, V_{CCA} = 2.25 V, V_{CCI} = 3.0 V, T_J = 70°C)
