Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

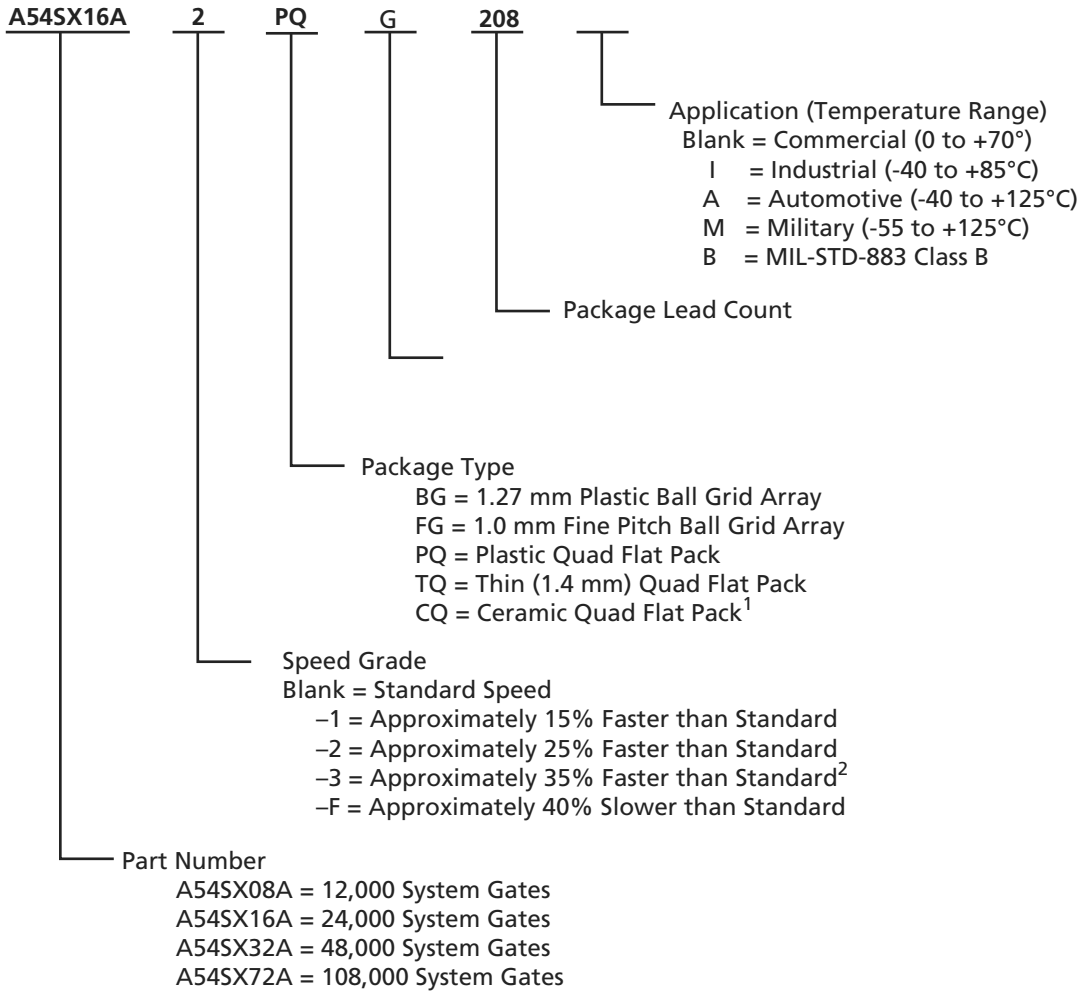
Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Obsolete
Number of LABs/CLBs	1452
Number of Logic Elements/Cells	-
Total RAM Bits	-
Number of I/O	175
Number of Gates	24000
Voltage - Supply	2.25V ~ 5.25V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 70°C (TA)
Package / Case	208-BFQFP
Supplier Device Package	208-PQFP (28x28)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/a54sx16a-2pq208

Ordering Information



Notes:

1. *For more information about the CQFP package options, refer to the* HiRel SX-A datasheet.
2. *All –3 speed grades have been discontinued.*

Notes: *Package Definitions: PQFP = Plastic Quad Flat Pack, TQFP = Thin Quad Flat Pack, PBGA = Plastic Ball Grid Array, FBGA = Fine Pitch Ball Grid Array*

Power-Up/Down and Hot Swapping

SX-A I/Os are configured to be hot-swappable, with the exception of 3.3 V PCI. During power-up/down (or partial up/down), all I/Os are tristated. V_{CCA} and V_{CCI} do not have to be stable during power-up/down, and can be powered up/down in any order. When the SX-A device is plugged into an electrically active system, the device will not degrade the reliability of or cause damage to the host system. The device's output pins are driven to a high impedance state until normal chip operating conditions are reached. Table 1-4 summarizes the V_{CCA} voltage at which the I/Os behave according to the user's design for an SX-A device at room temperature for various ramp-up rates. The data reported assumes a linear ramp-up profile to 2.5 V. For more information on power-up and hot-swapping, refer to the application note, *Actel SX-A and RT54SX-S Devices in Hot-Swap and Cold-Sparing Applications*.

Table 1-2 • **I/O Features**

Function	Description
Input Buffer Threshold Selections	• 5 V: PCI, TTL • 3.3 V: PCI, LVTTL • 2.5 V: LVCMOS2 (commercial only)
Flexible Output Driver	• 5 V: PCI, TTL • 3.3 V: PCI, LVTTL • 2.5 V: LVCMOS2 (commercial only)
Output Buffer	"Hot-Swap" Capability (3.3 V PCI is not hot swappable) • I/O on an unpowered device does not sink current • Can be used for "cold-sparing" Selectable on an individual I/O basis Individually selectable slew rate; high slew or low slew (The default is high slew rate). The slew is only affected on the falling edge of an output. Rising edges of outputs are not affected.
Power-Up	Individually selectable pull-ups and pull-downs during power-up (default is to power-up in tristate) Enables deterministic power-up of device V_{CCA} and V_{CCI} can be powered in any order

Table 1-3 • **I/O Characteristics for All I/O Configurations**

	Hot Swappable	Slew Rate Control	Power-Up Resistor
TTL, LVTTL, LVCMOS2	Yes	Yes. Only affects falling edges of outputs	Pull-up or pull-down
3.3 V PCI	No	No. High slew rate only	Pull-up or pull-down
5 V PCI	Yes	No. High slew rate only	Pull-up or pull-down

Table 1-4 • **Power-Up Time at which I/Os Become Active**

Supply Ramp Rate	0.25 V/µs	0.025 V/µs	5 V/ms	2.5 V/ms	0.5 V/ms	0.25 V/ms	0.1 V/ms	0.025 V/ms
Units	**µs**	**µs**	**ms**	**ms**	**ms**	**ms**	**ms**	**ms**
A54SX08A	10	96	0.34	0.65	2.7	5.4	12.9	50.8
A54SX16A	10	100	0.36	0.62	2.5	4.7	11.0	41.6
A54SX32A	10	100	0.46	0.74	2.8	5.2	12.1	47.2
A54SX72A	10	100	0.41	0.67	2.6	5.0	12.1	47.2

Boundary-Scan Testing (BST)

All SX-A devices are IEEE 1149.1 compliant and offer superior diagnostic and testing capabilities by providing Boundary Scan Testing (BST) and probing capabilities. The BST function is controlled through the special JTAG pins (TMS, TDI, TCK, TDO, and TRST). The functionality of the JTAG pins is defined by two available modes: Dedicated and Flexible. TMS cannot be employed as a user I/O in either mode.

Dedicated Mode

In Dedicated mode, all JTAG pins are reserved for BST; designers cannot use them as regular I/Os. An internal pull-up resistor is automatically enabled on both TMS and TDI pins, and the TMS pin will function as defined in the IEEE 1149.1 (JTAG) specification.

To select Dedicated mode, the user must reserve the JTAG pins in Actel's Designer software. Reserve the JTAG pins by checking the **Reserve JTAG** box in the Device Selection Wizard (Figure 1-12).

The default for the software is Flexible mode; all boxes are unchecked. Table 1-5 lists the definitions of the options in the Device Selection Wizard.

Figure 1-12 • **Device Selection Wizard**

Table 1-5 • **Reserve Pin Definitions**

Pin	Function
Reserve JTAG	Keeps pins from being used and changes the behavior of JTAG pins (no pull-up on TMS)
Reserve JTAG Test Reset	Regular I/O or JTAG reset with an internal pull-up
Reserve Probe	Keeps pins from being used or regular I/O

Flexible Mode

In Flexible mode, TDI, TCK, and TDO may be employed as either user I/Os or as JTAG input pins. The internal resistors on the TMS and TDI pins are not present in flexible JTAG mode.

To select the Flexible mode, uncheck the **Reserve JTAG** box in the Device Selection Wizard dialog in the Actel Designer software. In Flexible mode, TDI, TCK, and TDO pins may function as user I/Os or BST pins. The functionality is controlled by the BST Test Access Port (TAP) controller. The TAP controller receives two control inputs, TMS and TCK. Upon power-up, the TAP controller enters the Test-Logic-Reset state. In this state, TDI, TCK, and TDO function as user I/Os. The TDI, TCK, and TDO are transformed from user I/Os into BST pins when a rising edge on TCK is detected while TMS is at logic low. To return to Test-Logic Reset state, TMS must be high for at least five TCK cycles. **An external 10 k pull-up resistor to V_{CCI} should be placed on the TMS pin to pull it High by default.**

Table 1-6 describes the different configuration requirements of BST pins and their functionality in different modes.

Table 1-6 • **Boundary-Scan Pin Configurations and Functions**

Mode	Designer "Reserve JTAG" Selection	TAP Controller State
Dedicated (JTAG)	Checked	Any
Flexible (User I/O)	Unchecked	Test-Logic-Reset
Flexible (JTAG)	Unchecked	Any EXCEPT Test-Logic-Reset

TRST Pin

The TRST pin functions as a dedicated Boundary-Scan Reset pin when the **Reserve JTAG Test Reset** option is selected as shown in Figure 1-12. An internal pull-up resistor is permanently enabled on the TRST pin in this mode. Actel recommends connecting this pin to ground in normal operation to keep the JTAG state controller in the Test-Logic-Reset state. When JTAG is being used, it can be left floating or can be driven high.

When the **Reserve JTAG Test Reset** option is not selected, this pin will function as a regular I/O. If unused as an I/O in the design, it will be configured as a tristated output.
