### [Understanding Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### **Applications of Embedded - FPGAs**

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

#### **Details**

Product Status	Active
Number of LABs/CLBs	1452
Number of Logic Elements/Cells	-
Total RAM Bits	-
Number of I/O	81
Number of Gates	24000
Voltage - Supply	2.25V ~ 5.25V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 70°C (TA)
Package / Case	100-LQFP
Supplier Device Package	100-TQFP (14x14)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/microchip-technology/a54sx16a-tqg100">https://www.e-xfl.com/product-detail/microchip-technology/a54sx16a-tqg100</a>

## Clock Resources

Actel's high-drive routing structure provides three clock networks (Table 1-1). The first clock, called HCLK, is hardwired from the HCLK buffer to the clock select multiplexor (MUX) in each R-cell. HCLK cannot be connected to combinatorial logic. This provides a fast propagation path for the clock signal. If not used, this pin must be set as Low or High on the board. It must not be left floating. Figure 1-7 describes the clock circuit used for the constant load HCLK and the macros supported.

HCLK does not function until the fourth clock cycle each time the device is powered up to prevent false output levels due to any possible slow power-on-reset signal and fast start-up clock circuit. To activate HCLK from the first cycle, the TRST pin must be reserved in the Design software and the pin must be tied to GND on the board.

Two additional clocks (CLKA, CLKB) are global clocks that can be sourced from external pins or from internal logic signals within the SX-A device. CLKA and CLKB may be connected to sequential cells or to combinational logic. If CLKA or CLKB pins are not used or sourced from signals, these pins must be set as Low or High on the board. They must not be left floating. Figure 1-8 describes the CLKA

and CLKB circuit used and the macros supported in SX-A devices with the exception of A54SX72A.

In addition, the A54SX72A device provides four quadrant clocks (QCLKA, QCLKB, QCLKC, and QCLKD—corresponding to bottom-left, bottom-right, top-left, and top-right locations on the die, respectively), which can be sourced from external pins or from internal logic signals within the device. Each of these clocks can individually drive up to an entire quadrant of the chip, or they can be grouped together to drive multiple quadrants (Figure 1-9 on page 1-6). QCLK pins can function as user I/O pins. If not used, the QCLK pins must be tied Low or High on the board and must not be left floating.

For more information on how to use quadrant clocks in the A54SX72A device, refer to the *Global Clock Networks in Actel's Antifuse Devices* and *Using A54SX72A and RT54SX72S Quadrant Clocks* application notes.

The CLKA, CLKB, and QCLK circuits for A54SX72A as well as the macros supported are shown in Figure 1-10 on page 1-6. Note that bidirectional clock buffers are only available in A54SX72A. For more information, refer to the "Pin Description" section on page 1-15.

Table 1-1 • SX-A Clock Resources

	<b>A54SX08A</b>	<b>A54SX16A</b>	<b>A54SX32A</b>	<b>A54SX72A</b>
Routed Clocks (CLKA, CLKB)	2	2	2	2
Hardwired Clocks (HCLK)	1	1	1	1
Quadrant Clocks (QCLKA, QCLKB, QCLKC, QCLKD)	0	0	0	4

## Other Architectural Features

### Technology

The Actel SX-A family is implemented on a high-voltage, twin-well CMOS process using  $0.22\text{ }\mu\text{ }/\text{ }0.25\text{ }\mu$  design rules. The metal-to-metal antifuse is comprised of a combination of amorphous silicon and dielectric material with barrier metals and has a programmed ('on' state) resistance of  $25\text{ }\Omega$  with capacitance of  $1.0\text{ fF}$  for low signal impedance.

### Performance

The unique architectural features of the SX-A family enable the devices to operate with internal clock frequencies of 350 MHz, causing very fast execution of even complex logic functions. The SX-A family is an optimal platform upon which to integrate the functionality previously contained in multiple complex programmable logic devices (CPLDs). In addition, designs that previously would have required a gate array to meet performance goals can be integrated into an SX-A device with dramatic improvements in cost and time-to-market. Using timing-driven place-and-route tools, designers can achieve highly deterministic device performance.

### User Security

Reverse engineering is virtually impossible in SX-A devices because it is extremely difficult to distinguish between programmed and unprogrammed antifuses. In addition, since SX-A is a nonvolatile, single-chip solution, there is no configuration bitstream to intercept at device power-up.

The Actel FuseLock advantage ensures that unauthorized users will not be able to read back the contents of an Actel antifuse FPGA. In addition to the inherent strengths of the architecture, special security fuses that prevent internal probing and overwriting are hidden throughout the fabric of the device. They are located where they cannot be accessed or bypassed without destroying access to the rest of the device, making both invasive and more-subtle noninvasive attacks ineffective against Actel antifuse FPGAs.

Look for this symbol to ensure your valuable IP is secure (Figure 1-11).

Figure 1-11 • FuseLock

For more information, refer to Actel's *Implementation of Security in Actel Antifuse FPGAs* application note.

### I/O Modules

For a simplified I/O schematic, refer to Figure 1 in the application note, *Actel eX, SX-A, and RTSX-S I/Os*.

Each user I/O on an SX-A device can be configured as an input, an output, a tristate output, or a bidirectional pin. Mixed I/O standards can be set for individual pins, though this is only allowed with the same voltage as the input. These I/Os, combined with array registers, can achieve clock-to-output-pad timing as fast as 3.8 ns, even without the dedicated I/O registers. In most FPGAs, I/O cells that have embedded latches and flip-flops, requiring instantiation in HDL code; this is a design complication not encountered in SX-A FPGAs. Fast pin-to-pin timing ensures that the device is able to interface with any other device in the system, which in turn enables parallel design of system components and reduces overall design time. All unused I/Os are configured as tristate outputs by the Actel Designer software, for maximum flexibility when designing new boards or migrating existing designs.

SX-A I/Os should be driven by high-speed push-pull devices with a low-resistance pull-up device when being configured as tristate output buffers. If the I/O is driven by a voltage level greater than  $V_{CCA}$  and a fast push-pull device is NOT used, the high-resistance pull-up of the driver and the internal circuitry of the SX-A I/O may create a voltage divider. This voltage divider could pull the input voltage below specification for some devices connected to the driver. A logic '1' may not be correctly presented in this case. For example, if an open drain driver is used with a pull-up resistor to 5 V to provide the logic '1' input, and  $V_{CCA}$  is set to 3.3 V on the SX-A device, the input signal may be pulled down by the SX-A input.

Each I/O module has an available power-up resistor of approximately  $50\text{ k}\Omega$  that can configure the I/O in a known state during power-up. For nominal pull-up and pull-down resistor values, refer to Table 1-4 on page 1-8 of the application note *Actel eX, SX-A, and RTSX-S I/Os*. Just slightly before  $V_{CCA}$  reaches 2.5 V, the resistors are disabled, so the I/Os will be controlled by user logic. See Table 1-2 on page 1-8 and Table 1-3 on page 1-8 for more information concerning available I/O features.

## Power-Up/Down and Hot Swapping

SX-A I/Os are configured to be hot-swappable, with the exception of 3.3 V PCI. During power-up/down (or partial up/down), all I/Os are tristated.  $V_{CCA}$  and  $V_{CCI}$  do not have to be stable during power-up/down, and can be powered up/down in any order. When the SX-A device is plugged into an electrically active system, the device will not degrade the reliability of or cause damage to the host system. The device's output pins are driven to a high impedance state until normal chip operating conditions

are reached. Table 1-4 summarizes the  $V_{CCA}$  voltage at which the I/Os behave according to the user's design for an SX-A device at room temperature for various ramp-up rates. The data reported assumes a linear ramp-up profile to 2.5 V. For more information on power-up and hot-swapping, refer to the application note, *Actel SX-A and RT54SX-S Devices in Hot-Swap and Cold-Sparing Applications*.

Table 1-2 • I/O Features

Function	Description
Input Buffer Threshold Selections	<ul style="list-style-type: none"> <li>• 5 V: PCI, TTL</li> <li>• 3.3 V: PCI, LVTTL</li> <li>• 2.5 V: LVCMOS2 (commercial only)</li> </ul>
Flexible Output Driver	<ul style="list-style-type: none"> <li>• 5 V: PCI, TTL</li> <li>• 3.3 V: PCI, LVTTL</li> <li>• 2.5 V: LVCMOS2 (commercial only)</li> </ul>
Output Buffer	<p>"Hot-Swap" Capability (3.3 V PCI is not hot swappable)</p> <ul style="list-style-type: none"> <li>• I/O on an unpowered device does not sink current</li> <li>• Can be used for "cold-sparing"</li> </ul> <p>Selectable on an individual I/O basis</p> <p>Individually selectable slew rate; high slew or low slew (The default is high slew rate). The slew is only affected on the falling edge of an output. Rising edges of outputs are not affected.</p>
Power-Up	<p>Individually selectable pull-ups and pull-downs during power-up (default is to power-up in tristate)</p> <p>Enables deterministic power-up of device</p> <p><math>V_{CCA}</math> and <math>V_{CCI}</math> can be powered in any order</p>

Table 1-3 • I/O Characteristics for All I/O Configurations

	Hot Swappable	Slew Rate Control	Power-Up Resistor
TTL, LVTTL, LVCMOS2	Yes	Yes. Only affects falling edges of outputs	Pull-up or pull-down
3.3 V PCI	No	No. High slew rate only	Pull-up or pull-down
5 V PCI	Yes	No. High slew rate only	Pull-up or pull-down

Table 1-4 • Power-Up Time at which I/Os Become Active

Supply Ramp Rate	0.25 V/ $\mu$ s	0.025 V/ $\mu$ s	5 V/ms	2.5 V/ms	0.5 V/ms	0.25 V/ms	0.1 V/ms	0.025 V/ms
Units	$\mu$ s	$\mu$ s	ms	ms	ms	ms	ms	ms
A54SX08A	10	96	0.34	0.65	2.7	5.4	12.9	50.8
A54SX16A	10	100	0.36	0.62	2.5	4.7	11.0	41.6
A54SX32A	10	100	0.46	0.74	2.8	5.2	12.1	47.2
A54SX72A	10	100	0.41	0.67	2.6	5.0	12.1	47.2

## Probing Capabilities

SX-A devices also provide an internal probing capability that is accessed with the JTAG pins. The Silicon Explorer II diagnostic hardware is used to control the TDI, TCK, TMS, and TDO pins to select the desired nets for debugging. The user assigns the selected internal nets in Actel Silicon Explorer II software to the PRA/PRB output pins for observation. Silicon Explorer II automatically places the device into JTAG mode. However, probing functionality is only activated when the TRST pin is driven high or left floating, allowing the internal pull-up resistor to pull TRST High. If the TRST pin is held Low, the TAP controller remains in the Test-Logic-Reset state so no probing can be performed. However, the user must drive the TRST pin High or allow the internal pull-up resistor to pull TRST High.

When selecting the **Reserve Probe Pin** box as shown in Figure 1-12 on page 1-9, direct the layout tool to reserve the PRA and PRB pins as dedicated outputs for probing. This **Reserve** option is merely a guideline. If the designer assigns user I/Os to the PRA and PRB pins and selects the **Reserve Probe Pin** option, Designer Layout will override the **Reserve Probe Pin** option and place the user I/Os on those pins.

To allow probing capabilities, the security fuse must not be programmed. Programming the security fuse disables the JTAG and probe circuitry. Table 1-9 summarizes the possible device configurations for probing once the device leaves the Test-Logic-Reset JTAG state.

Table 1-9 • Device Configuration Options for Probe Capability (TRST Pin Reserved)

JTAG Mode	TRST <sup>1</sup>	Security Fuse Programmed	PRA, PRB <sup>2</sup>	TDI, TCK, TDO <sup>2</sup>
Dedicated	Low	No	User I/O <sup>3</sup>	JTAG Disabled
	High	No	Probe Circuit Outputs	JTAG I/O
Flexible	Low	No	User I/O <sup>3</sup>	User I/O <sup>3</sup>
	High	No	Probe Circuit Outputs	JTAG I/O
		Yes	Probe Circuit Secured	Probe Circuit Secured

**Notes:**

1. If the TRST pin is not reserved, the device behaves according to TRST = High as described in the table.
2. Avoid using the TDI, TCK, TDO, PRA, and PRB pins as input or bidirectional ports. Since these pins are active during probing, input signals will not pass through these pins and may cause contention.
3. If no user signal is assigned to these pins, they will behave as unused I/Os in this mode. Unused pins are automatically tristated by the Designer software.

Figure 2-1 shows the 5 V PCI V/I curve and the minimum and maximum PCI drive characteristics of the SX-A family.

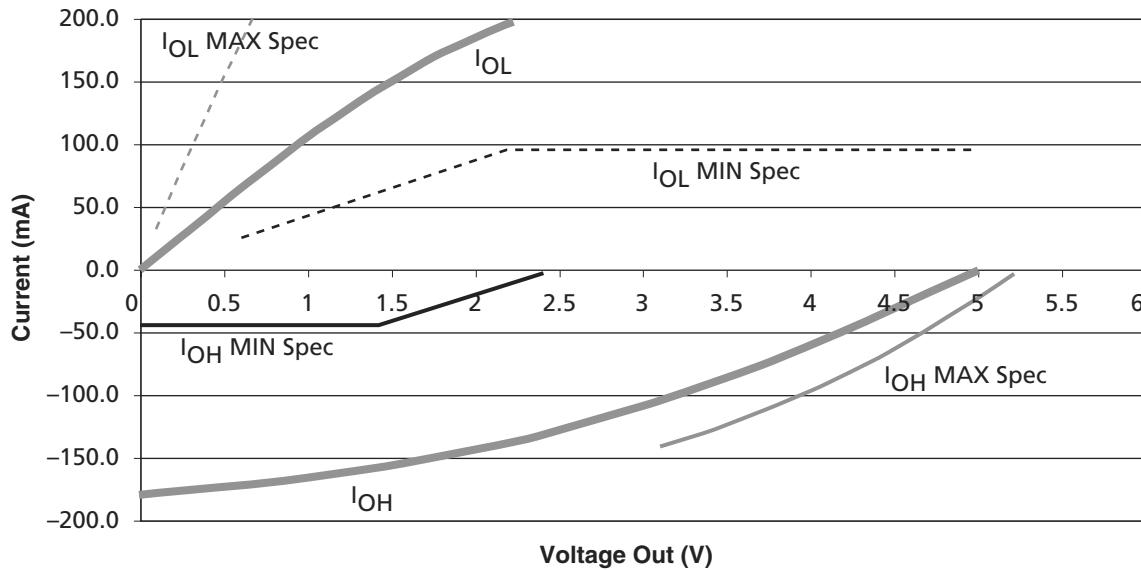

Figure 2-1 • 5 V PCI V/I Curve for SX-A Family

$$I_{OH} = 11.9 * (V_{OUT} - 5.25) * (V_{OUT} + 2.45)$$

for  $V_{CCI} > V_{OUT} > 3.1V$

$$I_{OL} = 78.5 * V_{OUT} * (4.4 - V_{OUT})$$

for  $0V < V_{OUT} < 0.71V$

EQ 2-1

EQ 2-2

Table 2-9 • DC Specifications (3.3 V PCI Operation)

Symbol	Parameter	Condition	Min.	Max.	Units
V <sub>CCA</sub>	Supply Voltage for Array		2.25	2.75	V
V <sub>CCI</sub>	Supply Voltage for I/Os		3.0	3.6	V
V <sub>IH</sub>	Input High Voltage		0.5V <sub>CCI</sub>	V <sub>CCI</sub> + 0.5	V
V <sub>IL</sub>	Input Low Voltage		-0.5	0.3V <sub>CCI</sub>	V
I <sub>IPU</sub>	Input Pull-up Voltage <sup>1</sup>		0.7V <sub>CCI</sub>	-	V
I <sub>IL</sub>	Input Leakage Current <sup>2</sup>	0 < V <sub>IN</sub> < V <sub>CCI</sub>	-10	+10	µA
V <sub>OH</sub>	Output High Voltage	I <sub>OUT</sub> = -500 µA	0.9V <sub>CCI</sub>	-	V
V <sub>OL</sub>	Output Low Voltage	I <sub>OUT</sub> = 1,500 µA		0.1V <sub>CCI</sub>	V
C <sub>IN</sub>	Input Pin Capacitance <sup>3</sup>		-	10	pF
C <sub>CLK</sub>	CLK Pin Capacitance		5	12	pF

#### Notes:

1. This specification should be guaranteed by design. It is the minimum voltage to which pull-up resistors are calculated to pull a floated network. Designers should ensure that the input buffer is conducting minimum current at this input voltage in applications sensitive to static power utilization.
2. Input leakage currents include hi-Z output leakage for all bidirectional buffers with tristate outputs.
3. Absolute maximum pin capacitance for a PCI input is 10 pF (except for CLK).

## Output Buffer Delays

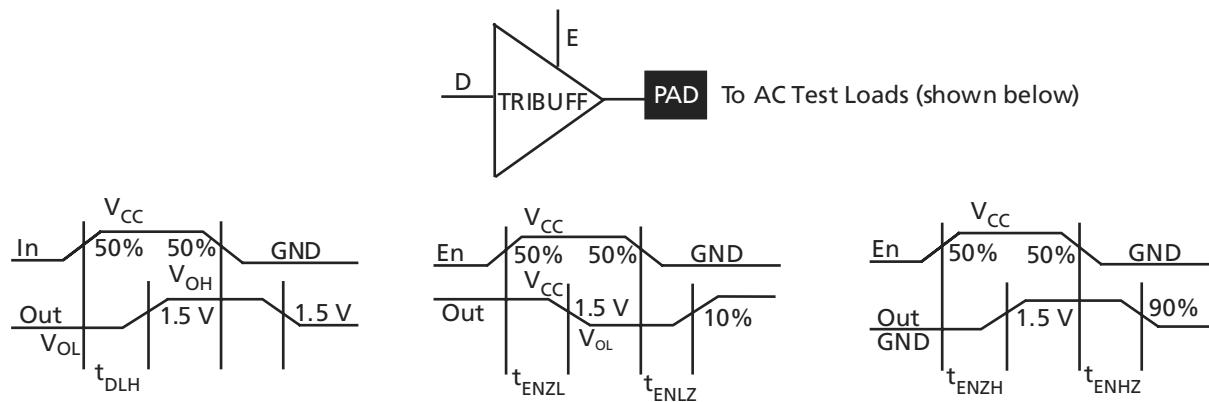

Figure 2-4 • Output Buffer Delays

## AC Test Loads

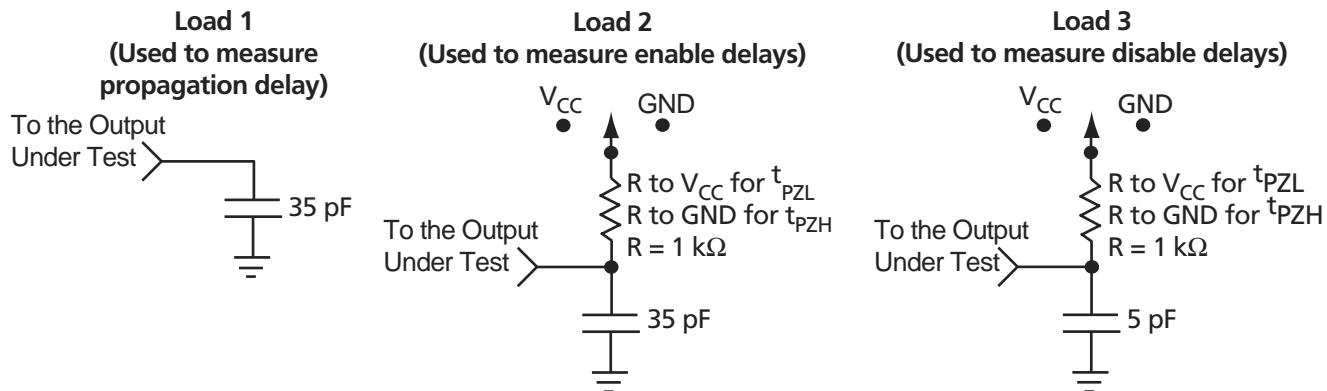

Figure 2-5 • AC Test Loads

Table 2-14 • A54SX08A Timing Characteristics (Continued)  
 (Worst-Case Commercial Conditions,  $V_{CCA} = 2.25\text{ V}$ ,  $V_{CCI} = 3.0\text{ V}$ ,  $T_J = 70^\circ\text{C}$ )

<b>Parameter</b>	<b>Description</b>	<b>-2 Speed</b>	<b>-1 Speed</b>	<b>Std. Speed</b>	<b>-F Speed</b>	<b>Units</b>
		<b>Min.</b>	<b>Max.</b>	<b>Min.</b>	<b>Max.</b>

$t_{INYL}$	Input Data Pad to Y Low 5 V PCI	0.8	0.9	1.1	1.5	ns
$t_{INYH}$	Input Data Pad to Y High 5 V TTL	0.5	0.6	0.7	0.9	ns
$t_{INYL}$	Input Data Pad to Y Low 5 V TTL	0.8	0.9	1.1	1.5	ns
<b>Input Module Predicted Routing Delays<sup>2</sup></b>						
$t_{IRD1}$	FO = 1 Routing Delay	0.3	0.3	0.4	0.6	ns
$t_{IRD2}$	FO = 2 Routing Delay	0.5	0.5	0.6	0.8	ns
$t_{IRD3}$	FO = 3 Routing Delay	0.6	0.7	0.8	1.1	ns
$t_{IRD4}$	FO = 4 Routing Delay	0.8	0.9	1	1.4	ns
$t_{IRD8}$	FO = 8 Routing Delay	1.4	1.5	1.8	2.5	ns
$t_{IRD12}$	FO = 12 Routing Delay	2	2.2	2.6	3.6	ns

**Notes:**

1. For dual-module macros, use  $t_{PD} + t_{RD1} + t_{PDn}$ ,  $t_{RCO} + t_{RD1} + t_{PDn}$ , or  $t_{PD1} + t_{RD1} + t_{SUD}$ , whichever is appropriate.
2. Routing delays are for typical designs across worst-case operating conditions. These parameters should be used for estimating device performance. Post-route timing analysis or simulation is required to determine actual performance.

$d_{THL}^3$	Delta High to Low	0.017	0.023	0.023	0.037	ns/pF				
$d_{THLS}^3$	Delta High to Low—low slew	0.06	0.071	0.086	0.117	ns/pF				

**Note:**

1. Delays based on 35 pF loading.
2. The equivalent I/O Attribute Editor settings for 2.5 V LVCMOS is 2.5 V LVTTL in the software.
3. To obtain the slew rate, substitute the appropriate Delta value, load capacitance, and the  $V_{CCI}$  value into the following equation:  

$$\text{Slew Rate [V/ns]} = (0.1 * V_{CCI} - 0.9 * V_{CCI}) / (C_{load} * d_{T[LH|HL|HLS]})$$
 where  $C_{load}$  is the load capacitance driven by the I/O in pF.  
 $d_{T[LH|HL|HLS]}$  is the worst case delta value from the datasheet in ns/pF.

**Notes:**

1. All -3 speed grades have been discontinued.
2. Delays based on 50 pF loading.
3. To obtain the slew rate, substitute the appropriate Delta value, load capacitance, and the  $V_{CCI}$  value into the following equation:  

$$\text{Slew Rate [V/ns]} = (0.1 * V_{CCI} - 0.9 * V_{CCI}) / (C_{load} * d_{T[LH|HL|HLS]})$$

where  $C_{load}$  is the load capacitance driven by the I/O in pF

$d_{T[LH|HL|HLS]}$  is the worst case delta value from the datasheet in ns/pF.
4. Delays based on 35 pF loading.
