Microchip Technology - A54SX16A-TQG144M Datasheet

Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

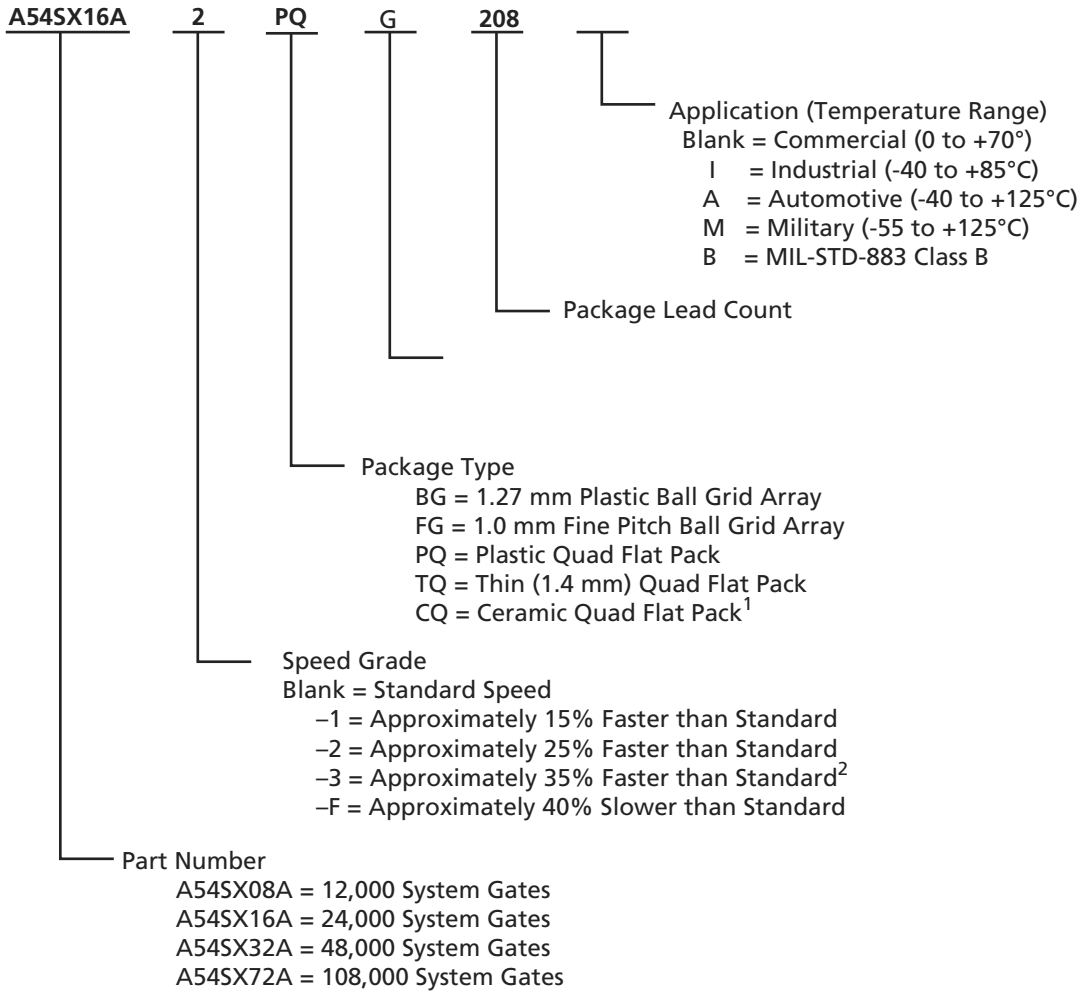
Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Active
Number of LABs/CLBs	1452
Number of Logic Elements/Cells	-
Total RAM Bits	-
Number of I/O	113
Number of Gates	24000
Voltage - Supply	2.25V ~ 5.25V
Mounting Type	Surface Mount
Operating Temperature	-55°C ~ 125°C (TC)
Package / Case	144-LQFP
Supplier Device Package	144-TQFP (20x20)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/a54sx16a-tqg144m

Ordering Information



Notes:

1. *For more information about the CQFP package options, refer to the* HiRel SX-A datasheet.
2. *All –3 speed grades have been discontinued.*

Logic Module Design

The SX-A family architecture is described as a "sea-of-modules" architecture because the entire floor of the device is covered with a grid of logic modules with virtually no chip area lost to interconnect elements or routing. The Actel SX-A family provides two types of logic modules: the register cell (R-cell) and the combinatorial cell (C-cell).

The R-cell contains a flip-flop featuring asynchronous clear, asynchronous preset, and clock enable, using the S0 and S1 lines control signals (Figure 1-2). The R-cell registers feature programmable clock polarity selectable on a register-by-register basis. This provides additional flexibility while allowing mapping of synthesized functions into the SX-A FPGA. The clock source for the R-cell can be chosen from either the hardwired clock, the routed clocks, or internal logic.

The C-cell implements a range of combinatorial functions of up to five inputs (Figure 1-3). Inclusion of the DB input and its associated inverter function allows up to 4,000 different combinatorial functions to be implemented in a single module. An example of the flexibility enabled by the inversion capability is the ability to integrate a 3-input exclusive-OR function into a single C-cell. This facilitates construction of 9-bit parity-tree functions with 1.9 ns propagation delays.

Module Organization

All C-cell and R-cell logic modules are arranged into horizontal banks called Clusters. There are two types of Clusters: Type 1 contains two C-cells and one R-cell, while Type 2 contains one C-cell and two R-cells.

Clusters are grouped together into SuperClusters (Figure 1-4 on page 1-3). SuperCluster 1 is a two-wide grouping of Type 1 Clusters. SuperCluster 2 is a two-wide group containing one Type 1 Cluster and one Type 2 Cluster. SX-A devices feature more SuperCluster 1 modules than SuperCluster 2 modules because designers typically require significantly more combinatorial logic than flip-flops.

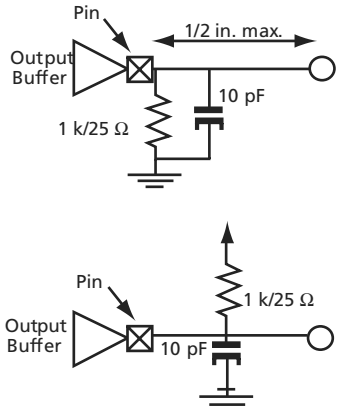
I_{CH}	High Clamp Current	$V_{CCI} + 4 > V_{IN} \ge V_{CCI} + 1$	$25 + (V_{IN} - V_{CCI} - 1)/0.015$	–	mA
$slew_R$	Output Rise Slew Rate	$0.2V_{CCI}$ - $0.6V_{CCI}$ load [3]	1	4	V/ns
$slew_F$	Output Fall Slew Rate	$0.6V_{CCI}$ - $0.2V_{CCI}$ load [3]	1	4	V/ns

Notes:

1. *Refer to the V/I curves in Figure 2-2 on page 2-7. Switching current characteristics for REQ# and GNT# are permitted to be one half of that specified here; i.e., half size output drivers may be used on these signals. This specification does not apply to CLK and RST#, which are system outputs. "Switching Current High" specifications are not relevant to SERR#, INTA#, INTB#, INTC#, and INTD#, which are open drain outputs.*
2. *Maximum current requirements must be met as drivers pull beyond the last step voltage. Equations defining these maximums (C and D) are provided with the respective diagrams in Figure 2-2 on page 2-7. The equation defined maximum should be met by design. In order to facilitate component testing, a maximum current test point is defined for each side of the output driver.*
3. *This parameter is to be interpreted as the cumulative edge rate across the specified range, rather than the instantaneous rate at any point within the transition range. The specified load (diagram below) is optional; i.e., the designer may elect to meet this parameter with an unloaded output per the latest revision of the PCI Local Bus Specification. However, adherence to both maximum and minimum parameters is required (the maximum is no longer simply a guideline). Rise slew rate does not apply to open drain outputs.*



Where:

C_{EQCM} = Equivalent capacitance of combinatorial modules (C-cells) in pF

C_{EQSM} = Equivalent capacitance of sequential modules (R-Cells) in pF

C_{EQI} = Equivalent capacitance of input buffers in pF

C_{EQO} = Equivalent capacitance of output buffers in pF

C_{EQCR} = Equivalent capacitance of CLKA/B in pF

C_{EQHV} = Variable capacitance of HCLK in pF

C_{EQHF} = Fixed capacitance of HCLK in pF

C_{L} = Output lead capacitance in pF

f_m = Average logic module switching rate in MHz

f_n = Average input buffer switching rate in MHz

f_p = Average output buffer switching rate in MHz

f_{q1} = Average CLKA rate in MHz

f_{q2} = Average CLKB rate in MHz

f_{s1} = Average HCLK rate in MHz

m = Number of logic modules switching at fm

n = Number of input buffers switching at fn

p = Number of output buffers switching at fp

q_1 = Number of clock loads on CLKA

q_2 = Number of clock loads on CLKB

r_1 = Fixed capacitance due to CLKA

r_2 = Fixed capacitance due to CLKB

s_1 = Number of clock loads on HCLK

x = Number of I/Os at logic low

y = Number of I/Os at logic high

Table 2-11 • **CEQ Values for SX-A Devices**

	A54SX08A	**A54SX16A**	**A54SX32A**	**A54SX72A**
Combinatorial modules (C_{EQCM})	1.70 pF	2.00 pF	2.00 pF	1.80 pF
Sequential modules (C_{EQCM})	1.50 pF	1.50 pF	1.30 pF	1.50 pF

Routed array clock A (r_1)	35.00 pF	50.00 pF	90.00 pF	310.00 pF

Guidelines for Estimating Power

The following guidelines are meant to represent worst-case scenarios; they can be generally used to predict the upper limits of power dissipation:

Logic Modules (m) = 20% of modules

Inputs Switching (n) = Number inputs/4

Outputs Switching (p) = Number of outputs/4

CLKA Loads (q1) = 20% of R-cells

CLKB Loads (q2) = 20% of R-cells

Load Capacitance (CL) = 35 pF

Average Logic Module Switching Rate (fm) = f/10

Average Input Switching Rate (fn) =f/5

Average Output Switching Rate (fp) = f/10

Average CLKA Rate (fq1) = f/2

Average CLKB Rate (fq2) = f/2

Average HCLK Rate (fs1) = f

HCLK loads (s1) = 20% of R-cells

To assist customers in estimating the power dissipations of their designs, Actel has published the *eX, SX-A and RT54SX-S Power Calculator* worksheet.

Theta-JA

Junction-to-ambient thermal resistance (θ_{JA}) is determined under standard conditions specified by JESD-51 series but has little relevance in actual performance of the product in real application. It should be employed with caution but is useful for comparing the thermal performance of one package to another.

A sample calculation to estimate the absolute maximum power dissipation allowed (worst case) for a 329-pin PBGA package at still air is as follows. i.e.:

θ_{JA} = 17.1°C/W is taken from Table 2-12 on page 2-11

T_A = 125°C is the maximum limit of ambient (from the datasheet)

$$\text{Max. Allowed Power} = \frac{\text{Max Junction Temp} - \text{Max. Ambient Temp}}{\theta_{JA}} = \frac{150°C - 125°C}{17.1°C/W} = 1.46\ W$$

EQ 2-11

The device's power consumption must be lower than the calculated maximum power dissipation by the package.

The power consumption of a device can be calculated using the Actel power calculator. If the power consumption is higher than the device's maximum allowable power dissipation, then a heat sink can be attached on top of the case or the airflow inside the system must be increased.

Theta-JC

Junction-to-case thermal resistance (θ_{JC}) measures the ability of a device to dissipate heat from the surface of the chip to the top or bottom surface of the package. It is applicable for packages used with external heat sinks and only applies to situations where all or nearly all of the heat is dissipated through the surface in consideration. If the power consumption is higher than the calculated maximum power dissipation of the package, then a heat sink is required.

Calculation for Heat Sink

For example, in a design implemented in a FG484 package, the power consumption value using the power calculator is 3.00 W. The user-dependent data T_J and T_A are given as follows:

T_J = 110°C

T_A = 70°C

From the datasheet:

θ_{JA} = 18.0°C/W

θ_{JC} = 3.2 °C/W

$$P = \frac{\text{Max Junction Temp} - \text{Max. Ambient Temp}}{\theta_{JA}} = \frac{110°C - 70°C}{18.0°C/W} = 2.22\ W$$

EQ 2-12

The 2.22 W power is less than then required 3.00 W; therefore, the design requires a heat sink or the airflow where the device is mounted should be increased. The design's junction-to-air thermal resistance requirement can be estimated by:

$$\theta_{JA} = \frac{\text{Max Junction Temp} - \text{Max. Ambient Temp}}{P} = \frac{110°C - 70°C}{3.00\ W} = 13.33°C/W$$

Notes:

1. *All –3 speed grades have been discontinued.*
2. *Delays based on 50 pF loading.*
3. *To obtain the slew rate, substitute the appropriate Delta value, load capacitance, and the V_{CCI} value into the following equation:*
   Slew Rate [V/ns] = $(0.1*V_{CCI} – 0.9*V_{CCI})/ (C_{load} * d_{T[LH|HL|HLS]})$
   where C_{load} is the load capacitance driven by the I/O in pF
   $d_{T[LH|HL|HLS]}$ is the worst case delta value from the datasheet in ns/pF.
4. *Delays based on 35 pF loading.*

Datasheet Information

List of Changes

The following table lists critical changes that were made in the current version of the document.

Previous Version	Changes in Current Version (v5.3)	Page
v5.2 (June 2006)	–3 speed grades have been discontinued.	N/A
	The "SX-A Timing Model" was updated with –2 data.	2-14
v5.1 February 2005	RoHS information was added to the "Ordering Information".	ii
	The "Programming" section was updated.	1-13
v5.0	Revised Table 1 and the timing data to reflect the phase out of the –3 speed grade for the A54SX08A device.	i
	The "Thermal Characteristics" section was updated.	2-11
	The "176-Pin TQFP" was updated to add pins 81 to 90.	3-11
	The "484-Pin FBGA" was updated to add pins R4 to Y26	3-26
v4.0	The "Temperature Grade Offering" is new.	1-iii
	The "Speed Grade and Temperature Grade Matrix" is new.	1-iii
	"SX-A Family Architecture" was updated.	1-1
	"Clock Resources" was updated.	1-5
	"User Security" was updated.	1-7
	"Power-Up/Down and Hot Swapping" was updated.	1-7
	"Dedicated Mode" is new	1-9
	Table 1-5 is new.	1-9
	"JTAG Instructions" is new	1-10
	"Design Considerations" was updated.	1-12
	The "Programming" section is new.	1-13
	"Design Environment" was updated.	1-13
	"Pin Description" was updated.	1-15
	Table 2-1 was updated.	2-1
	Table 2-2 was updated.	2-1
	Table 2-3 is new.	2-1
	Table 2-4 is new.	2-1
	Table 2-5 was updated.	2-2
	Table 2-6 was updated.	2-2
	"Power Dissipation" is new.	2-8
	Table 2-11 was updated.	2-9

Previous Version	Changes in Current Version (v5.3)	Page
v4.0 (continued)	Table 2-12 was updated.	2-11
	The was updated.	2-14
	The "Sample Path Calculations" were updated.	2-14
	Table 2-13 was updated.	2-17
	Table 2-13 was updated.	2-17
	All timing tables were updated.	2-18 to 2-52
v3.0	The "Actel Secure Programming Technology with FuseLock™ Prevents Reverse Engineering and Design Theft" section was updated.	1-i
	The "Ordering Information" section was updated.	1-ii
	The "Temperature Grade Offering" section was updated.	1-iii
	The Figure 1-1 • SX-A Family Interconnect Elements was updated.	1-1
	The ""Clock Resources" section"was updated	1-5
	The Table 1-1 • SX-A Clock Resources is new.	1-5
	The "User Security" section is new.	1-7
	The "I/O Modules" section was updated.	1-7
	The Table 1-2 • I/O Features was updated.	1-8
	The Table 1-3 • I/O Characteristics for All I/O Configurations is new.	1-8
	The Table 1-4 • Power-Up Time at which I/Os Become Active is new	1-8
	The Figure 1-12 • Device Selection Wizard is new.	1-9
	The "Boundary-Scan Pin Configurations and Functions" section is new.	1-9
	The Table 1-9 • Device Configuration Options for Probe Capability (TRST Pin Reserved) is new.	1-11
	The "SX-A Probe Circuit Control Pins" section was updated.	1-12
	The "Design Considerations" section was updated.	1-12
	The Figure 1-13 • Probe Setup was updated.	1-12
	The Design Environment was updated.	1-13
	The Figure 1-13 • Design Flow is new.	1-11
	The "Absolute Maximum Ratings*" section was updated.	1-12
	The "Recommended Operating Conditions" section was updated.	1-12
	The "Electrical Specifications" section was updated.	1-12
	The "2.5V LVCMOS2 Electrical Specifications" section was updated.	1-13
	The "SX-A Timing Model" and "Sample Path Calculations" equations were updated.	1-23
	The "Pin Description" section was updated.	1-15
v2.0.1	The "Design Environment" section has been updated.	1-13
	The "I/O Modules" section, and Table 1-2 • I/O Features have been updated.	1-8
	The "SX-A Timing Model" section and the "Timing Characteristics" section have new timing numbers.	1-23
