Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details

Product Status	Active
Number of LABs/CLBs	2880
Number of Logic Elements/Cells	-
Total RAM Bits	-
Number of I/O	174
Number of Gates	48000
Voltage - Supply	2.25V ~ 5.25V
Mounting Type	Surface Mount
Operating Temperature	-55°C ~ 125°C (TJ)
Package / Case	208-BFCQFP with Tie Bar
Supplier Device Package	208-CQFP (75x75)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/a54sx32a-1cq208b

Clock Resources

Actel's high-drive routing structure provides three clock networks (Table 1-1). The first clock, called HCLK, is hardwired from the HCLK buffer to the clock select multiplexor (MUX) in each R-cell. HCLK cannot be connected to combinatorial logic. This provides a fast propagation path for the clock signal. If not used, this pin must be set as Low or High on the board. It must not be left floating. Figure 1-7 describes the clock circuit used for the constant load HCLK and the macros supported.

HCLK does not function until the fourth clock cycle each time the device is powered up to prevent false output levels due to any possible slow power-on-reset signal and fast start-up clock circuit. To activate HCLK from the first cycle, the TRST pin must be reserved in the Design software and the pin must be tied to GND on the board.

Two additional clocks (CLKA, CLKB) are global clocks that can be sourced from external pins or from internal logic signals within the SX-A device. CLKA and CLKB may be connected to sequential cells or to combinatorial logic. If CLKA or CLKB pins are not used or sourced from signals, these pins must be set as Low or High on the board. They must not be left floating. Figure 1-8 describes the CLKA

and CLKB circuit used and the macros supported in SX-A devices with the exception of A54SX72A.

In addition, the A54SX72A device provides four quadrant clocks (QCLKA, QCLKB, QCLKC, and QCLKD—corresponding to bottom-left, bottom-right, top-left, and top-right locations on the die, respectively), which can be sourced from external pins or from internal logic signals within the device. Each of these clocks can individually drive up to an entire quadrant of the chip, or they can be grouped together to drive multiple quadrants (Figure 1-9 on page 1-6). QCLK pins can function as user I/O pins. If not used, the QCLK pins must be tied Low or High on the board and must not be left floating.

For more information on how to use quadrant clocks in the A54SX72A device, refer to the *Global Clock Networks in Actel's Antifuse Devices and Using A54SX72A and RT54SX72S Quadrant Clocks* application notes.

The CLKA, CLKB, and QCLK circuits for A54SX72A as well as the macros supported are shown in Figure 1-10 on page 1-6. Note that bidirectional clock buffers are only available in A54SX72A. For more information, refer to the "Pin Description" section on page 1-15.

Table 1-1 • SX-A Clock Resources

	A54SX08A	A54SX16A	A54SX32A	A54SX72A
Routed Clocks (CLKA, CLKB)	2	2	2	2
Hardwired Clocks (HCLK)	1	1	1	1
Quadrant Clocks (QCLKA, QCLKB, QCLKC, QCLKD)	0	0	0	4

Figure 1-10 • A54SX72A Routed Clock and QCLK Buffer

Boundary-Scan Testing (BST)

All SX-A devices are IEEE 1149.1 compliant and offer superior diagnostic and testing capabilities by providing Boundary Scan Testing (BST) and probing capabilities. The BST function is controlled through the special JTAG pins (TMS, TDI, TCK, TDO, and TRST). The functionality of the JTAG pins is defined by two available modes: Dedicated and Flexible. TMS cannot be employed as a user I/O in either mode.

Dedicated Mode

In Dedicated mode, all JTAG pins are reserved for BST; designers cannot use them as regular I/Os. An internal pull-up resistor is automatically enabled on both TMS and TDI pins, and the TMS pin will function as defined in the IEEE 1149.1 (JTAG) specification.

To select Dedicated mode, the user must reserve the JTAG pins in Actel's Designer software. Reserve the JTAG pins by checking the **Reserve JTAG** box in the Device Selection Wizard (Figure 1-12).

The default for the software is Flexible mode; all boxes are unchecked. Table 1-5 lists the definitions of the options in the Device Selection Wizard.

Flexible Mode

In Flexible mode, TDI, TCK, and TDO may be employed as either user I/Os or as JTAG input pins. The internal resistors on the TMS and TDI pins are not present in flexible JTAG mode.

To select the Flexible mode, uncheck the **Reserve JTAG** box in the Device Selection Wizard dialog in the Actel Designer software. In Flexible mode, TDI, TCK, and TDO pins may function as user I/Os or BST pins. The functionality is controlled by the BST Test Access Port (TAP) controller. The TAP controller receives two control inputs, TMS and TCK. Upon power-up, the TAP controller enters the Test-Logic-Reset state. In this state, TDI, TCK, and TDO function as user I/Os. The TDI, TCK, and TDO are transformed from user I/Os into BST pins when a rising edge on TCK is detected while TMS is at logic low. To return to Test-Logic Reset state, TMS must be high for at least five TCK cycles. **An external 10 k pull-up resistor to V_{CC} should be placed on the TMS pin to pull it High by default.**

Table 1-6 describes the different configuration requirements of BST pins and their functionality in different modes.

Table 1-6 • Boundary-Scan Pin Configurations and Functions

Mode	Designer "Reserve JTAG" Selection	TAP Controller State
Dedicated (JTAG)	Checked	Any
Flexible (User I/O)	Unchecked	Test-Logic-Reset
Flexible (JTAG)	Unchecked	Any EXCEPT Test-Logic-Reset

TRST Pin

The TRST pin functions as a dedicated Boundary-Scan Reset pin when the **Reserve JTAG Test Reset** option is selected as shown in Figure 1-12. An internal pull-up resistor is permanently enabled on the TRST pin in this mode. Actel recommends connecting this pin to ground in normal operation to keep the JTAG state controller in the Test-Logic-Reset state. When JTAG is being used, it can be left floating or can be driven high.

When the **Reserve JTAG Test Reset** option is not selected, this pin will function as a regular I/O. If unused as an I/O in the design, it will be configured as a tristated output.

Figure 1-12 • Device Selection Wizard

Table 1-5 • Reserve Pin Definitions

Pin	Function
Reserve JTAG	Keeps pins from being used and changes the behavior of JTAG pins (no pull-up on TMS)
Reserve JTAG Test Reset	Regular I/O or JTAG reset with an internal pull-up
Reserve Probe	Keeps pins from being used or regular I/O

Figure 2-1 shows the 5 V PCI V/I curve and the minimum and maximum PCI drive characteristics of the SX-A family.

Figure 2-1 • 5 V PCI V/I Curve for SX-A Family

$$I_{OH} = 11.9 * (V_{OUT} - 5.25) * (V_{OUT} + 2.45)$$

for $V_{CCI} > V_{OUT} > 3.1V$

EQ 2-1

$$I_{OL} = 78.5 * V_{OUT} * (4.4 - V_{OUT})$$

for $0V < V_{OUT} < 0.71V$

EQ 2-2

Table 2-9 • DC Specifications (3.3 V PCI Operation)

Symbol	Parameter	Condition	Min.	Max.	Units
V_{CCA}	Supply Voltage for Array		2.25	2.75	V
V_{CCI}	Supply Voltage for I/Os		3.0	3.6	V
V_{IH}	Input High Voltage		$0.5V_{CCI}$	$V_{CCI} + 0.5$	V
V_{IL}	Input Low Voltage		-0.5	$0.3V_{CCI}$	V
I_{IPU}	Input Pull-up Voltage ¹		$0.7V_{CCI}$	–	V
I_{IL}	Input Leakage Current ²	$0 < V_{IN} < V_{CCI}$	-10	+10	μA
V_{OH}	Output High Voltage	$I_{OUT} = -500 \mu A$	$0.9V_{CCI}$	–	V
V_{OL}	Output Low Voltage	$I_{OUT} = 1,500 \mu A$		$0.1V_{CCI}$	V
C_{IN}	Input Pin Capacitance ³		–	10	pF
C_{CLK}	CLK Pin Capacitance		5	12	pF

Notes:

1. This specification should be guaranteed by design. It is the minimum voltage to which pull-up resistors are calculated to pull a floated network. Designers should ensure that the input buffer is conducting minimum current at this input voltage in applications sensitive to static power utilization.
2. Input leakage currents include hi-Z output leakage for all bidirectional buffers with tristate outputs.
3. Absolute maximum pin capacitance for a PCI input is 10 pF (except for CLK).

Thermal Characteristics

Introduction

The temperature variable in Actel Designer software refers to the junction temperature, not the ambient, case, or board temperatures. This is an important distinction because dynamic and static power consumption will cause the chip's junction to be higher than the ambient, case, or board temperatures. EQ 2-9 and EQ 2-10 give the relationship between thermal resistance, temperature gradient and power.

$$\theta_{JA} = \frac{T_J - T_A}{P}$$

EQ 2-9

$$\theta_{JA} = \frac{T_C - T_A}{P}$$

EQ 2-10

Where:

- θ_{JA} = Junction-to-air thermal resistance
- θ_{JC} = Junction-to-case thermal resistance
- T_J = Junction temperature
- T_A = Ambient temperature
- T_C = Ambient temperature
- P = total power dissipated by the device

Table 2-12 • Package Thermal Characteristics

Package Type	Pin Count	θ_{JC}	θ_{JA}			Units
			Still Air	1.0 m/s 200 ft./min.	2.5 m/s 500 ft./min.	
Thin Quad Flat Pack (TQFP)	100	14	33.5	27.4	25	°C/W
Thin Quad Flat Pack (TQFP)	144	11	33.5	28	25.7	°C/W
Thin Quad Flat Pack (TQFP)	176	11	24.7	19.9	18	°C/W
Plastic Quad Flat Pack (PQFP) ¹	208	8	26.1	22.5	20.8	°C/W
Plastic Quad Flat Pack (PQFP) with Heat Spreader ²	208	3.8	16.2	13.3	11.9	°C/W
Plastic Ball Grid Array (PBGA)	329	3	17.1	13.8	12.8	°C/W
Fine Pitch Ball Grid Array (FBGA)	144	3.8	26.9	22.9	21.5	°C/W
Fine Pitch Ball Grid Array (FBGA)	256	3.8	26.6	22.8	21.5	°C/W
Fine Pitch Ball Grid Array (FBGA)	484	3.2	18	14.7	13.6	°C/W

Notes:

- The A54SX08A PQ208 has no heat spreader.
- The SX-A PQ208 package has a heat spreader for A54SX16A, A54SX32A, and A54SX72A.

Theta-JA

Junction-to-ambient thermal resistance (θ_{JA}) is determined under standard conditions specified by JESD-51 series but has little relevance in actual performance of the product in real application. It should be employed with caution but is useful for comparing the thermal performance of one package to another.

A sample calculation to estimate the absolute maximum power dissipation allowed (worst case) for a 329-pin PBGA package at still air is as follows. i.e.:

$$\theta_{JA} = 17.1^{\circ}\text{C/W} \text{ is taken from Table 2-12 on page 2-11}$$

$$T_A = 125^{\circ}\text{C} \text{ is the maximum limit of ambient (from the datasheet)}$$

$$\text{Max. Allowed Power} = \frac{\text{Max Junction Temp} - \text{Max. Ambient Temp}}{\theta_{JA}} = \frac{150^{\circ}\text{C} - 125^{\circ}\text{C}}{17.1^{\circ}\text{C/W}} = 1.46 \text{ W}$$

EQ 2-11

The device's power consumption must be lower than the calculated maximum power dissipation by the package.

The power consumption of a device can be calculated using the Actel power calculator. If the power consumption is higher than the device's maximum allowable power dissipation, then a heat sink can be attached on top of the case or the airflow inside the system must be increased.

Theta-JC

Junction-to-case thermal resistance (θ_{JC}) measures the ability of a device to dissipate heat from the surface of the chip to the top or bottom surface of the package. It is applicable for packages used with external heat sinks and only applies to situations where all or nearly all of the heat is dissipated through the surface in consideration. If the power consumption is higher than the calculated maximum power dissipation of the package, then a heat sink is required.

Calculation for Heat Sink

For example, in a design implemented in a FG484 package, the power consumption value using the power calculator is 3.00 W. The user-dependent data T_J and T_A are given as follows:

$$T_J = 110^{\circ}\text{C}$$

$$T_A = 70^{\circ}\text{C}$$

From the datasheet:

$$\theta_{JA} = 18.0^{\circ}\text{C/W}$$

$$\theta_{JC} = 3.2^{\circ}\text{C/W}$$

$$P = \frac{\text{Max Junction Temp} - \text{Max. Ambient Temp}}{\theta_{JA}} = \frac{110^{\circ}\text{C} - 70^{\circ}\text{C}}{18.0^{\circ}\text{C/W}} = 2.22 \text{ W}$$

EQ 2-12

The 2.22 W power is less than then required 3.00 W; therefore, the design requires a heat sink or the airflow where the device is mounted should be increased. The design's junction-to-air thermal resistance requirement can be estimated by:

$$\theta_{JA} = \frac{\text{Max Junction Temp} - \text{Max. Ambient Temp}}{P} = \frac{110^{\circ}\text{C} - 70^{\circ}\text{C}}{3.00 \text{ W}} = 13.33^{\circ}\text{C/W}$$

EQ 2-13

Notes:

1. All -3 speed grades have been discontinued.
2. For dual-module macros, use $t_{PD} + t_{RD1} + t_{PDn}$, $t_{RCO} + t_{RD1} + t_{PDn}$, or $t_{PD1} + t_{RD1} + t_{SUD}$, whichever is appropriate.
3. Routing delays are for typical designs across worst-case operating conditions. These parameters should be used for estimating device performance. Post-route timing analysis or simulation is required to determine actual performance.

(Worst-Case Commercial Conditions $V_{CCA} = 2.25\text{ V}$, $V_{CCI} = 2.3\text{ V}$, $T_J = 70^\circ\text{C}$)

Parameter	Description	–3 Speed ¹		–2 Speed		–1 Speed		Std. Speed		–F Speed		Units
		Min.	Max.	Min.	Max.	Min.	Max.	Min.	Max.	Min.	Max.	
2.5 V LVCMOS Output Module Timing ^{2, 3}												
t _{DLH}	Data-to-Pad Low to High	3.9		4.5		5.1		6.0		8.4		ns
t _{DHL}	Data-to-Pad High to Low	3.1		3.6		4.1		4.8		6.7		ns
t _{DHLS}	Data-to-Pad High to Low—low slew	12.7		14.6		16.5		19.4		27.2		ns
t _{ENZL}	Enable-to-Pad, Z to L	2.4		2.8		3.2		3.7		5.2		ns
t _{ENZLS}	Data-to-Pad, Z to L—low slew	11.8		13.7		15.5		18.2		25.5		ns
t _{ENZH}	Enable-to-Pad, Z to H	3.9		4.5		5.1		6.0		8.4		ns
t _{ENLZ}	Enable-to-Pad, L to Z	2.1		2.5		2.8		3.3		4.7		ns
t _{ENHZ}	Enable-to-Pad, H to Z	3.1		3.6		4.1		4.8		6.7		ns
d _{TLH} ⁴	Delta Low to High	0.031		0.037		0.043		0.051		0.071		ns/pF
d _{THL} ⁴	Delta High to Low	0.017		0.017		0.023		0.023		0.037		ns/pF
d _{THLS} ⁴	Delta High to Low—low slew	0.057		0.06		0.071		0.086		0.117		ns/pF

Note:

1. All –3 speed grades have been discontinued.
2. Delays based on 35 pF loading.
3. The equivalent IO Attribute settings for 2.5 V LVC MOS is 2.5 V LV TTL in the software.
4. To obtain the slew rate, substitute the appropriate Delta value, load capacitance, and the V_{CCI} value into the following equation:

$$\text{Slew Rate [V/ns]} = (0.1 * V_{CCI} - 0.9 * V_{CCI}) / (C_{load} * d_{T[LH|HL|HLS]})$$
 where C_{load} is the load capacitance driven by the I/O in pF
 $d_{T[LH|HL|HLS]}$ is the worst case delta value from the datasheet in ns/pF.

Datasheet Categories

In order to provide the latest information to designers, some datasheets are published before data has been fully characterized. Datasheets are designated as "Product Brief," "Advanced," "Production," and "Datasheet Supplement." The definitions of these categories are as follows:

Product Brief

The product brief is a summarized version of a datasheet (advanced or production) containing general product information. This brief gives an overview of specific device and family information.

Advanced

This datasheet version contains initial estimated information based on simulation, other products, devices, or speed grades. This information can be used as estimates, but not for production.

Unmarked (production)

This datasheet version contains information that is considered to be final.

Datasheet Supplement

The datasheet supplement gives specific device information for a derivative family that differs from the general family datasheet. The supplement is to be used in conjunction with the datasheet to obtain more detailed information and for specifications that do not differ between the two families.

International Traffic in Arms Regulations (ITAR) and Export Administration Regulations (EAR)

The products described in this datasheet are subject to the International Traffic in Arms Regulations (ITAR) or the Export Administration Regulations (EAR). They may require an approved export license prior to their export. An export can include a release or disclosure to a foreign national inside or outside the United States.
