### **Understanding Embedded - FPGAs (Field Programmable Gate Array)**

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### **Applications of Embedded - FPGAs**

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

#### **Details**

Product Status	Obsolete
Number of LABs/CLBs	2880
Number of Logic Elements/Cells	-
Total RAM Bits	-
Number of I/O	249
Number of Gates	48000
Voltage - Supply	2.25V ~ 5.25V
Mounting Type	Surface Mount
Operating Temperature	-55°C ~ 125°C (TC)
Package / Case	484-BGA
Supplier Device Package	484-FPBGA (27X27)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/microsemi/a54sx32a-1fgg484m">https://www.e-xfl.com/product-detail/microsemi/a54sx32a-1fgg484m</a>

# General Description

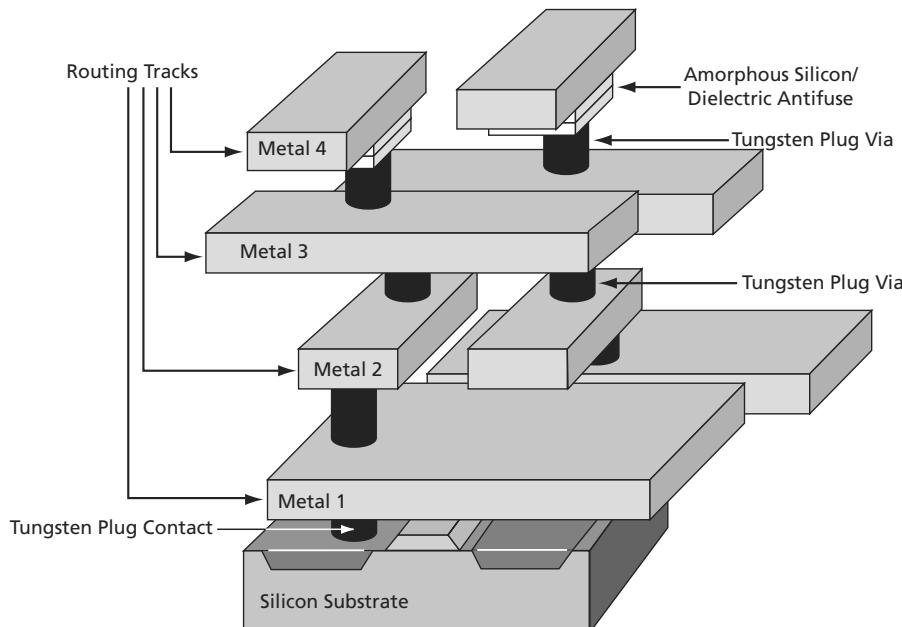

## Introduction

The Actel SX-A family of FPGAs offers a cost-effective, single-chip solution for low-power, high-performance designs. Fabricated on  $0.22\text{ }\mu\text{m} / 0.25\text{ }\mu\text{m}$  CMOS antifuse technology and with the support of 2.5 V, 3.3 V and 5 V I/Os, the SX-A is a versatile platform to integrate designs while significantly reducing time-to-market.

## SX-A Family Architecture

The SX-A family's device architecture provides a unique approach to module organization and chip routing that satisfies performance requirements and delivers the most optimal register/logic mix for a wide variety of applications.

Interconnection between these logic modules is achieved using Actel's patented metal-to-metal programmable antifuses interconnect elements (Figure 1-1). The antifuses are normally open circuit and, when programmed, form a permanent low-impedance connection.

**Note:** The A54SX72A device has four layers of metal with the antifuse between Metal 3 and Metal 4. The A54SX08A, A54SX16A, and A54SX32A devices have three layers of metal with the antifuse between Metal 2 and Metal 3.

Figure 1-1 • SX-A Family Interconnect Elements

Figure 1-5 • DirectConnect and FastConnect for Type 1 SuperClusters

Figure 1-6 • DirectConnect and FastConnect for Type 2 SuperClusters

## Design Environment

The SX-A family of FPGAs is fully supported by both Actel Libero® Integrated Design Environment (IDE) and Designer FPGA development software. Actel Libero IDE is a design management environment, seamlessly integrating design tools while guiding the user through the design flow, managing all design and log files, and passing necessary design data among tools. Additionally, Libero IDE allows users to integrate both schematic and HDL synthesis into a single flow and verify the entire design in a single environment. Libero IDE includes Synplify® for Actel from Synplicity®, ViewDraw® for Actel from Mentor Graphics®, ModelSim® HDL Simulator from Mentor Graphics, WaveFormer Lite™ from SynaptiCAD™, and Designer software from Actel. Refer to the *Libero IDE* flow diagram for more information (located on the Actel website).

Actel Designer software is a place-and-route tool and provides a comprehensive suite of backend support tools for FPGA development. The Designer software includes timing-driven place-and-route, and a world-class integrated static timing analyzer and constraints editor. With the Designer software, a user can select and lock package pins while only minimally impacting the results of place-and-route. Additionally, the back-annotation flow is compatible with all the major simulators and the simulation results can be cross-probed with Silicon Explorer II, Actel's integrated verification and logic analysis tool. Another tool included in the Designer software is the SmarGen core generator, which easily creates popular and commonly used logic functions for implementation in your schematic or HDL design. Actel's Designer software is compatible with the most popular FPGA design entry and verification tools from companies such as Mentor Graphics, Synplicity, Synopsys, and Cadence Design Systems. The Designer software is available for both the Windows and UNIX operating systems.

## Programming

Device programming is supported through Silicon Sculptor series of programmers. In particular, Silicon Sculptor is compact, robust, single-site and multi-site device programmer for the PC.

With standalone software, Silicon Sculptor allows concurrent programming of multiple units from the same PC, ensuring the fastest programming times possible. Each fuse is subsequently verified by Silicon Sculptor II to insure correct programming. In addition, integrity tests ensure that no extra fuses are programmed. Silicon Sculptor also provides extensive hardware self-testing capability.

The procedure for programming an SX-A device using Silicon Sculptor is as follows:

1. Load the .AFM file
2. Select the device to be programmed
3. Begin programming

When the design is ready to go to production, Actel offers device volume-programming services either through distribution partners or via in-house programming from the factory.

For detailed information on programming, read the following documents *Programming Antifuse Devices* and *Silicon Sculptor User's Guide*.

## PCI Compliance for the SX-A Family

The SX-A family supports 3.3 V and 5 V PCI and is compliant with the PCI Local Bus Specification Rev. 2.1.

Table 2-7 • DC Specifications (5 V PCI Operation)

Symbol	Parameter	Condition	Min.	Max.	Units
$V_{CCA}$	Supply Voltage for Array		2.25	2.75	V
$V_{CCI}$	Supply Voltage for I/Os		4.75	5.25	V
$V_{IH}$	Input High Voltage		2.0	5.75	V
$V_{IL}$	Input Low Voltage		-0.5	0.8	V
$I_{IH}$	Input High Leakage Current <sup>1</sup>	$V_{IN} = 2.7$	-	70	$\mu A$
$I_{IL}$	Input Low Leakage Current <sup>1</sup>	$V_{IN} = 0.5$	-	-70	$\mu A$
$V_{OH}$	Output High Voltage	$I_{OUT} = -2 \text{ mA}$	2.4	-	V
$V_{OL}$	Output Low Voltage <sup>2</sup>	$I_{OUT} = 3 \text{ mA}, 6 \text{ mA}$	-	0.55	V
$C_{IN}$	Input Pin Capacitance <sup>3</sup>		-	10	pF
$C_{CLK}$	CLK Pin Capacitance		5	12	pF

**Notes:**

1. Input leakage currents include hi-Z output leakage for all bidirectional buffers with tristate outputs.
2. Signals without pull-up resistors must have 3 mA low output current. Signals requiring pull-up must have 6 mA; the latter includes FRAME#, IRDY#, TRDY#, DEVSEL#, STOP#, SERR#, PERR#, LOCK#, and, when used AD[63::32], C/BE[7::4]#, PAR64, REQ64#, and ACK64#.
3. Absolute maximum pin capacitance for a PCI input is 10 pF (except for CLK).

Figure 2-1 shows the 5 V PCI V/I curve and the minimum and maximum PCI drive characteristics of the SX-A family.

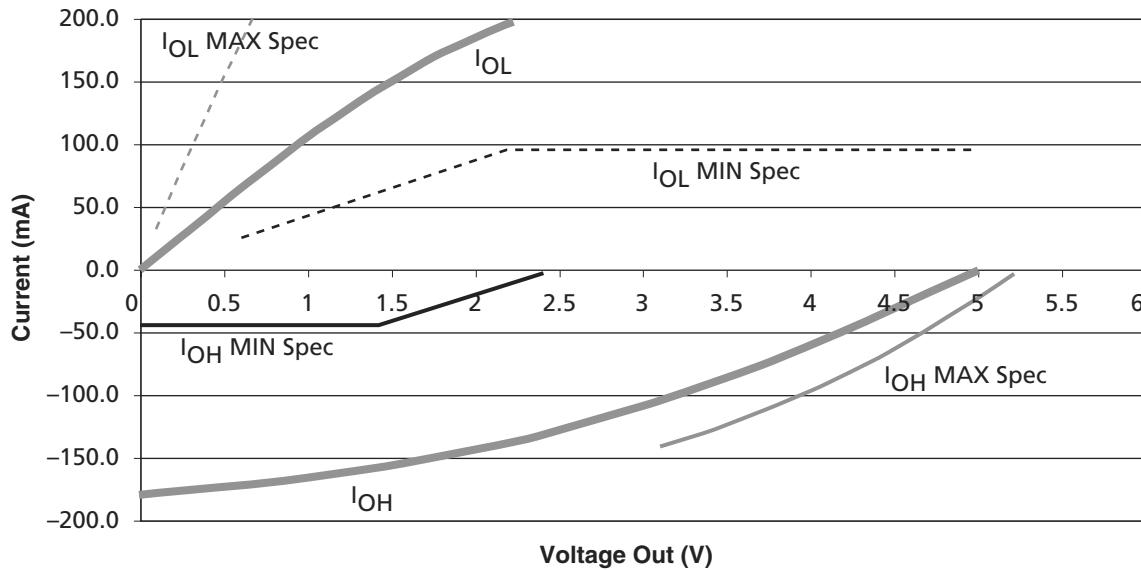

Figure 2-1 • 5 V PCI V/I Curve for SX-A Family

$$I_{OH} = 11.9 * (V_{OUT} - 5.25) * (V_{OUT} + 2.45)$$

for  $V_{CCI} > V_{OUT} > 3.1V$

EQ 2-1

$$I_{OL} = 78.5 * V_{OUT} * (4.4 - V_{OUT})$$

for  $0V < V_{OUT} < 0.71V$

EQ 2-2

Table 2-9 • DC Specifications (3.3 V PCI Operation)

Symbol	Parameter	Condition	Min.	Max.	Units
$V_{CCA}$	Supply Voltage for Array		2.25	2.75	V
$V_{CCI}$	Supply Voltage for I/Os		3.0	3.6	V
$V_{IH}$	Input High Voltage		$0.5V_{CCI}$	$V_{CCI} + 0.5$	V
$V_{IL}$	Input Low Voltage		-0.5	$0.3V_{CCI}$	V
$I_{IPU}$	Input Pull-up Voltage <sup>1</sup>		$0.7V_{CCI}$	-	V
$I_{IL}$	Input Leakage Current <sup>2</sup>	$0 < V_{IN} < V_{CCI}$	-10	+10	$\mu A$
$V_{OH}$	Output High Voltage	$I_{OUT} = -500 \mu A$	$0.9V_{CCI}$	-	V
$V_{OL}$	Output Low Voltage	$I_{OUT} = 1,500 \mu A$		$0.1V_{CCI}$	V
$C_{IN}$	Input Pin Capacitance <sup>3</sup>		-	10	pF
$C_{CLK}$	CLK Pin Capacitance		5	12	pF

#### Notes:

1. This specification should be guaranteed by design. It is the minimum voltage to which pull-up resistors are calculated to pull a floated network. Designers should ensure that the input buffer is conducting minimum current at this input voltage in applications sensitive to static power utilization.
2. Input leakage currents include hi-Z output leakage for all bidirectional buffers with tristate outputs.
3. Absolute maximum pin capacitance for a PCI input is 10 pF (except for CLK).

## Theta-JA

Junction-to-ambient thermal resistance ( $\theta_{JA}$ ) is determined under standard conditions specified by JESD-51 series but has little relevance in actual performance of the product in real application. It should be employed with caution but is useful for comparing the thermal performance of one package to another.

A sample calculation to estimate the absolute maximum power dissipation allowed (worst case) for a 329-pin PBGA package at still air is as follows. i.e.:

$\theta_{JA} = 17.1^\circ\text{C/W}$  is taken from Table 2-12 on page 2-11

$T_A = 125^\circ\text{C}$  is the maximum limit of ambient (from the datasheet)

$$\text{Max. Allowed Power} = \frac{\text{Max Junction Temp} - \text{Max. Ambient Temp}}{\theta_{JA}} = \frac{150^\circ\text{C} - 125^\circ\text{C}}{17.1^\circ\text{C/W}} = 1.46 \text{ W}$$

EQ 2-11

The device's power consumption must be lower than the calculated maximum power dissipation by the package.

The power consumption of a device can be calculated using the Actel power calculator. If the power consumption is higher than the device's maximum allowable power dissipation, then a heat sink can be attached on top of the case or the airflow inside the system must be increased.

## Theta-JC

Junction-to-case thermal resistance ( $\theta_{JC}$ ) measures the ability of a device to dissipate heat from the surface of the chip to the top or bottom surface of the package. It is applicable for packages used with external heat sinks and only applies to situations where all or nearly all of the heat is dissipated through the surface in consideration. If the power consumption is higher than the calculated maximum power dissipation of the package, then a heat sink is required.

## Calculation for Heat Sink

For example, in a design implemented in a FG484 package, the power consumption value using the power calculator is 3.00 W. The user-dependent data  $T_J$  and  $T_A$  are given as follows:

$T_J = 110^\circ\text{C}$

$T_A = 70^\circ\text{C}$

From the datasheet:

$\theta_{JA} = 18.0^\circ\text{C/W}$

$\theta_{JC} = 3.2^\circ\text{C/W}$

$$P = \frac{\text{Max Junction Temp} - \text{Max. Ambient Temp}}{\theta_{JA}} = \frac{110^\circ\text{C} - 70^\circ\text{C}}{18.0^\circ\text{C/W}} = 2.22 \text{ W}$$

EQ 2-12

The 2.22 W power is less than then required 3.00 W; therefore, the design requires a heat sink or the airflow where the device is mounted should be increased. The design's junction-to-air thermal resistance requirement can be estimated by:

$$\theta_{JA} = \frac{\text{Max Junction Temp} - \text{Max. Ambient Temp}}{P} = \frac{110^\circ\text{C} - 70^\circ\text{C}}{3.00 \text{ W}} = 13.33^\circ\text{C/W}$$

EQ 2-13

Table 2-14 • A54SX08A Timing Characteristics (Continued)  
 (Worst-Case Commercial Conditions,  $V_{CCA} = 2.25\text{ V}$ ,  $V_{CCI} = 3.0\text{ V}$ ,  $T_J = 70^\circ\text{C}$ )

<b>Parameter</b>	<b>Description</b>	<b>-2 Speed</b>	<b>-1 Speed</b>	<b>Std. Speed</b>	<b>-F Speed</b>	<b>Units</b>
		<b>Min.</b>	<b>Max.</b>	<b>Min.</b>	<b>Max.</b>	
$t_{INYH}$	Input Data Pad to Y High 5 V PCI	0.5	0.6	0.7	0.9	ns
$t_{INYL}$	Input Data Pad to Y Low 5 V PCI	0.8	0.9	1.1	1.5	ns
$t_{INYH}$	Input Data Pad to Y High 5 V TTL	0.5	0.6	0.7	0.9	ns
$t_{INYL}$	Input Data Pad to Y Low 5 V TTL	0.8	0.9	1.1	1.5	ns
<b>Input Module Predicted Routing Delays<sup>2</sup></b>						
$t_{IRD1}$	FO = 1 Routing Delay	0.3	0.3	0.4	0.6	ns
$t_{IRD2}$	FO = 2 Routing Delay	0.5	0.5	0.6	0.8	ns
$t_{IRD3}$	FO = 3 Routing Delay	0.6	0.7	0.8	1.1	ns
$t_{IRD4}$	FO = 4 Routing Delay	0.8	0.9	1	1.4	ns
$t_{IRD8}$	FO = 8 Routing Delay	1.4	1.5	1.8	2.5	ns
$t_{IRD12}$	FO = 12 Routing Delay	2	2.2	2.6	3.6	ns

**Notes:**

1. For dual-module macros, use  $t_{PD} + t_{RD1} + t_{PDn}$ ,  $t_{RCO} + t_{RD1} + t_{PDn}$ , or  $t_{PD1} + t_{RD1} + t_{SUD}$ , whichever is appropriate.
2. Routing delays are for typical designs across worst-case operating conditions. These parameters should be used for estimating device performance. Post-route timing analysis or simulation is required to determine actual performance.

**Note:**

1. All -3 speed grades have been discontinued.
2. Delays based on 35 pF loading.
3. The equivalent IO Attribute settings for 2.5 V LVC MOS is 2.5 V LVTTL in the software.
4. To obtain the slew rate, substitute the appropriate Delta value, load capacitance, and the  $V_{CCI}$  value into the following equation:  

$$\text{Slew Rate [V/ns]} = (0.1 * V_{CCI} - 0.9 * V_{CCI}) / (C_{load} * d_{T[LH|HL|HLS]})$$
 where  $C_{load}$  is the load capacitance driven by the I/O in pF  
 $d_{T[LH|HL|HLS]}$  is the worst case delta value from the datasheet in ns/pF.

**Notes:**

1. All -3 speed grades have been discontinued.
2. Delays based on 10 pF loading and 25  $\Omega$  resistance.
3. To obtain the slew rate, substitute the appropriate Delta value, load capacitance, and the  $V_{CCI}$  value into the following equation:  

$$\text{Slew Rate [V/ns]} = (0.1 * V_{CCI} - 0.9 * V_{CCI}) / (C_{load} * d_{T[LH|HL|HLS]})$$

where  $C_{load}$  is the load capacitance driven by the I/O in pF.  
 $d_{T[LH|HL|HLS]}$  is the worst case delta value from the datasheet in ns/pF.
4. Delays based on 35 pF loading.
