Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Obsolete
Number of LABs/CLBs	2880
Number of Logic Elements/Cells	-
Total RAM Bits	-
Number of I/O	81
Number of Gates	48000
Voltage - Supply	2.25V ~ 5.25V
Mounting Type	Surface Mount
Operating Temperature	-55°C ~ 125°C (TC)
Package / Case	100-LQFP
Supplier Device Package	100-TQFP (14x14)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/a54sx32a-1tq100m

General Description

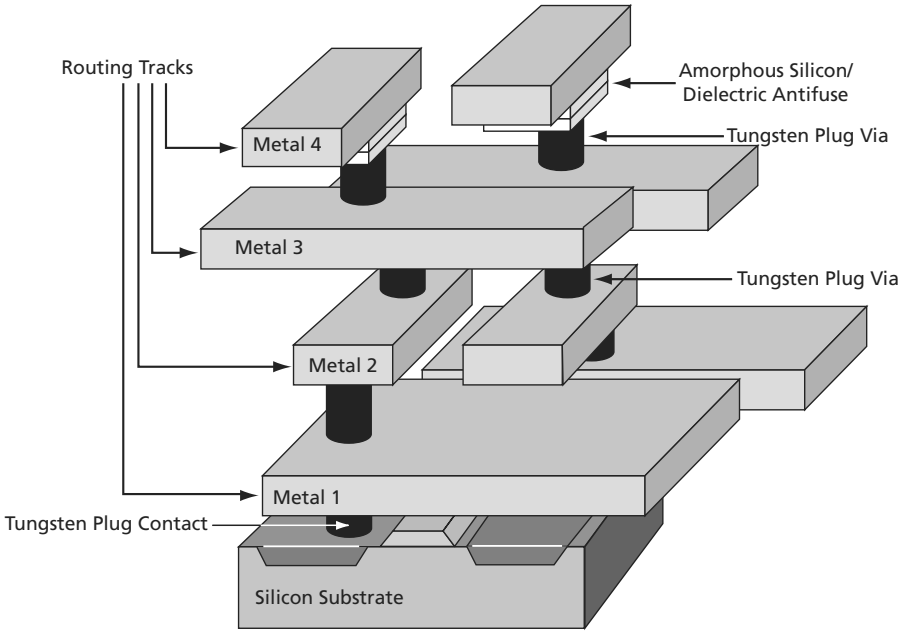
Introduction

The Actel SX-A family of FPGAs offers a cost-effective, single-chip solution for low-power, high-performance designs. Fabricated on 0.22 µm / 0.25 µm CMOS antifuse technology and with the support of 2.5 V, 3.3 V and 5 V I/Os, the SX-A is a versatile platform to integrate designs while significantly reducing time-to-market.

SX-A Family Architecture

The SX-A family's device architecture provides a unique approach to module organization and chip routing that satisfies performance requirements and delivers the most optimal register/logic mix for a wide variety of applications.

Interconnection between these logic modules is achieved using Actel's patented metal-to-metal programmable antifuse interconnect elements (Figure 1-1). The antifuses are normally open circuit and, when programmed, form a permanent low-impedance connection.



Note: *The A54SX72A device has four layers of metal with the antifuse between Metal 3 and Metal 4. The A54SX08A, A54SX16A, and A54SX32A devices have three layers of metal with the antifuse between Metal 2 and Metal 3.*

Figure 1-1 • **SX-A Family Interconnect Elements**

Routing Resources

The routing and interconnect resources of SX-A devices are in the top two metal layers above the logic modules (Figure 1-1 on page 1-1), providing optimal use of silicon, thus enabling the entire floor of the device to be spanned with an uninterrupted grid of logic modules. Interconnection between these logic modules is achieved using the Actel patented metal-to-metal programmable antifuse interconnect elements. The antifuses are normally open circuits and, when programmed, form a permanent low-impedance connection.

Clusters and SuperClusters can be connected through the use of two innovative local routing resources called FastConnect and DirectConnect, which enable extremely fast and predictable interconnection of modules within Clusters and SuperClusters (Figure 1-5 on page 1-4 and Figure 1-6 on page 1-4). This routing architecture also dramatically reduces the number of antifuses required to complete a circuit, ensuring the highest possible performance, which is often required in applications such as fast counters, state machines, and data path logic. The interconnect elements (i.e., the antifuses and metal tracks) have lower capacitance and lower resistance than any other device of similar capacity, leading to the fastest signal propagation in the industry.

DirectConnect is a horizontal routing resource that provides connections from a C-cell to its neighboring R-Cell in a given SuperCluster. DirectConnect uses a hardwired signal path requiring no programmable interconnection to achieve its fast signal propagation time of less than 0.1 ns.

FastConnect enables horizontal routing between any two logic modules within a given SuperCluster, and vertical routing with the SuperCluster immediately below it. Only one programmable connection is used in a FastConnect path, delivering a maximum pin-to-pin propagation time of 0.3 ns.

In addition to DirectConnect and FastConnect, the architecture makes use of two globally oriented routing resources known as segmented routing and high-drive routing. The Actel segmented routing structure provides a variety of track lengths for extremely fast routing between SuperClusters. The exact combination of track lengths and antifuses within each path is chosen by the 100% automatic place-and-route software to minimize signal propagation delays.

The general system of routing tracks allows any logic module in the array to be connected to any other logic or I/O module. Within this system, most connections typically require three or fewer antifuses, resulting in fast and predictable performance.

The unique local and general routing structure featured in SX-A devices allows 100% pin-locking with full logic utilization, enables concurrent printed circuit board (PCB) development, reduces design time, and allows designers to achieve performance goals with minimum effort.

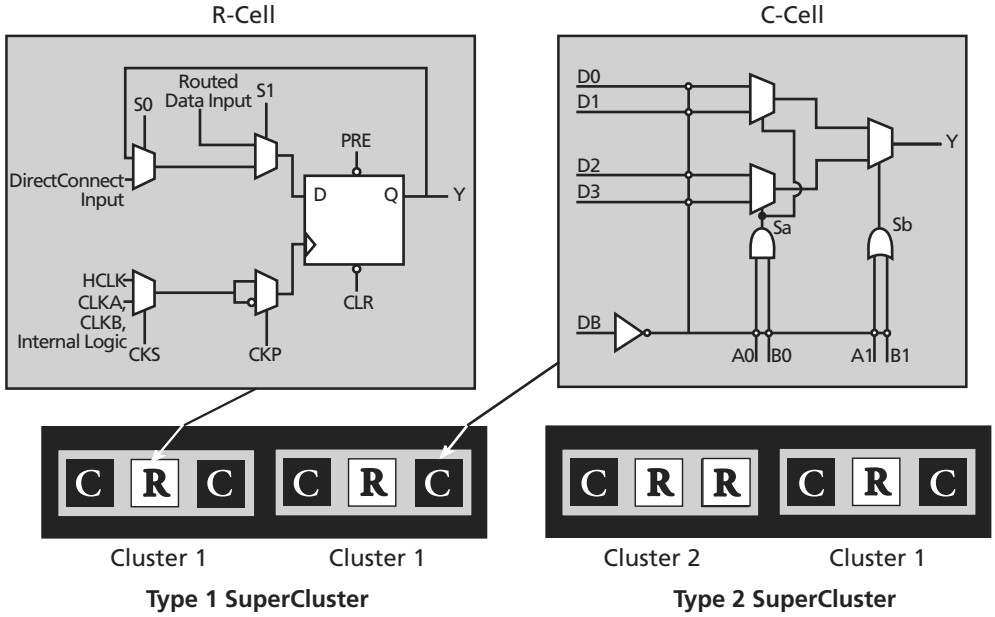


Figure 1-4 • **Cluster Organization**

Clock Resources

Actel's high-drive routing structure provides three clock networks (Table 1-1). The first clock, called HCLK, is hardwired from the HCLK buffer to the clock select multiplexor (MUX) in each R-cell. HCLK cannot be connected to combinatorial logic. This provides a fast propagation path for the clock signal. If not used, this pin must be set as Low or High on the board. It must not be left floating. Figure 1-7 describes the clock circuit used for the constant load HCLK and the macros supported.

HCLK does not function until the fourth clock cycle each time the device is powered up to prevent false output levels due to any possible slow power-on-reset signal and fast start-up clock circuit. To activate HCLK from the first cycle, the TRST pin must be reserved in the Design software and the pin must be tied to GND on the board.

Two additional clocks (CLKA, CLKB) are global clocks that can be sourced from external pins or from internal logic signals within the SX-A device. CLKA and CLKB may be connected to sequential cells or to combinational logic. If CLKA or CLKB pins are not used or sourced from signals, these pins must be set as Low or High on the board. They must not be left floating. Figure 1-8 describes the CLKA and CLKB circuit used and the macros supported in SX-A devices with the exception of A54SX72A.

In addition, the A54SX72A device provides four quadrant clocks (QCLKA, QCLKB, QCLKC, and QCLKD—corresponding to bottom-left, bottom-right, top-left, and top-right locations on the die, respectively), which can be sourced from external pins or from internal logic signals within the device. Each of these clocks can individually drive up to an entire quadrant of the chip, or they can be grouped together to drive multiple quadrants (Figure 1-9 on page 1-6). QCLK pins can function as user I/O pins. If not used, the QCLK pins must be tied Low or High on the board and must not be left floating.

For more information on how to use quadrant clocks in the A54SX72A device, refer to the *Global Clock Networks in Actel's Antifuse Device*s and *Using A54SX72A and RT54SX72S Quadrant Clocks* application notes.

The CLKA, CLKB, and QCLK circuits for A54SX72A as well as the macros supported are shown in Figure 1-10 on page 1-6. Note that bidirectional clock buffers are only available in A54SX72A. For more information, refer to the "Pin Description" section on page 1-15.

Table 1-1 • **SX-A Clock Resources**

	A54SX08A	A54SX16A	A54SX32A	A54SX72A
Routed Clocks (CLKA, CLKB)	2	2	2	2
Hardwired Clocks (HCLK)	1	1	1	1
Quadrant Clocks (QCLKA, QCLKB, QCLKC, QCLKD)	0	0	0	4

JTAG Instructions

Table 1-7 lists the supported instructions with the corresponding IR codes for SX-A devices.

Table 1-8 lists the codes returned after executing the IDCODE instruction for SX-A devices. Note that bit 0 is always '1'. Bits 11-1 are always '02F', which is the Actel manufacturer code.

Design Environment

The SX-A family of FPGAs is fully supported by both Actel Libero® Integrated Design Environment (IDE) and Designer FPGA development software. Actel Libero IDE is a design management environment, seamlessly integrating design tools while guiding the user through the design flow, managing all design and log files, and passing necessary design data among tools. Additionally, Libero IDE allows users to integrate both schematic and HDL synthesis into a single flow and verify the entire design in a single environment. Libero IDE includes Synplify® for Actel from Synplicity®, ViewDraw® for Actel from Mentor Graphics®, Model*Sim*® HDL Simulator from Mentor Graphics, WaveFormer Lite™ from SynaptiCAD™, and Designer software from Actel. Refer to the *Libero IDE flow* diagram for more information (located on the Actel website).

Actel Designer software is a place-and-route tool and provides a comprehensive suite of backend support tools for FPGA development. The Designer software includes timing-driven place-and-route, and a world-class integrated static timing analyzer and constraints editor. With the Designer software, a user can select and lock package pins while only minimally impacting the results of place-and-route. Additionally, the back-annotation flow is compatible with all the major simulators and the simulation results can be cross-probed with Silicon Explorer II, Actel's integrated verification and logic analysis tool. Another tool included in the Designer software is the SmarGen core generator, which easily creates popular and commonly used logic functions for implementation in your schematic or HDL design. Actel's Designer software is compatible with the most popular FPGA design entry and verification tools from companies such as Mentor Graphics, Synplicity, Synopsys, and Cadence Design Systems. The Designer software is available for both the Windows and UNIX operating systems.

Programming

Device programming is supported through Silicon Sculptor series of programmers. In particular, Silicon Sculptor is compact, robust, single-site and multi-site device programmer for the PC.

With standalone software, Silicon Sculptor allows concurrent programming of multiple units from the same PC, ensuring the fastest programming times possible. Each fuse is subsequently verified by Silicon Sculptor II to insure correct programming. In addition, integrity tests ensure that no extra fuses are programmed. Silicon Sculptor also provides extensive hardware self-testing capability.

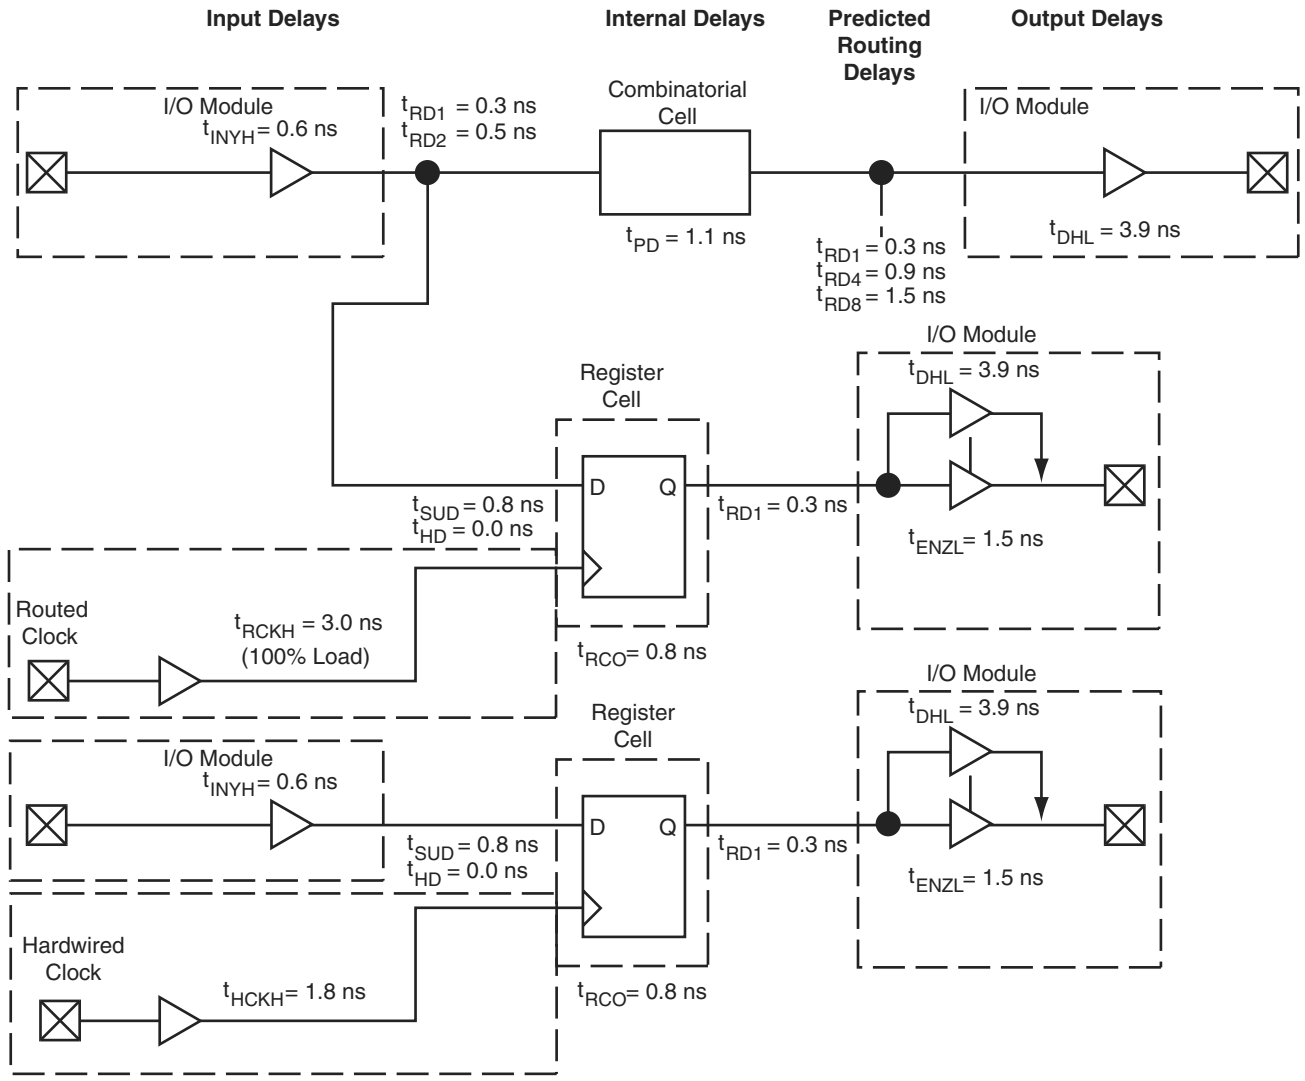
The procedure for programming an SX-A device using Silicon Sculptor is as follows:

1. Load the .AFM file
2. Select the device to be programmed
3. Begin programming

When the design is ready to go to production, Actel offers device volume-programming services either through distribution partners or via in-house programming from the factory.

For detailed information on programming, read the following documents *Programming Antifuse Devices* and *Silicon Sculptor User's Guide*.

SX-A Timing Model



Note: **Values shown for A54SX72A, –2, worst-case commercial conditions at 5 V PCI with standard place-and-route.*

Figure 2-3 • **SX-A Timing Model**

Sample Path Calculations

Hardwired Clock

External Setup = $(t_{INYH} + t_{RD1} + t_{SUD}) - t_{HCKH}$
= 0.6 + 0.3 + 0.8 - 1.8 = – 0.1 ns

Clock-to-Out (Pad-to-Pad) = $t_{HCKH} + t_{RCO} + t_{RD1} + t_{DHL}$
= 1.8 + 0.8 + 0.3 + 3.9 = 6.8 ns

Routed Clock

External Setup = $(t_{INYH} + t_{RD1} + t_{SUD}) - t_{RCKH}$
= 0.6 + 0.3 + 0.8 - 3.0 = –1.3 ns

Clock-to-Out (Pad-to-Pad) = $t_{RCKH} + t_{RCO} + t_{RD1} + t_{DHL}$
= 3.0 + 0.8 + 0.3 + 3.9 = 8.0 ns

d_{THLS}[4]	Delta High to Low—low slew		0.057		0.06		0.071		0.086		0.117	ns/pF

Note:

1. *All –3 speed grades have been discontinued.*
2. *Delays based on 35 pF loading.*
3. *The equivalent IO Attribute settings for 2.5 V LVCMOS is 2.5 V LVTTL in the software.*
4. *To obtain the slew rate, substitute the appropriate Delta value, load capacitance, and the V_{CCI} value into the following equation:*
   Slew Rate [V/ns] = $(0.1*V_{CCI} – 0.9*V_{CCI})/ (C_{load} * d_{T[LH|HL|HLS]})$
   where C_{load} is the load capacitance driven by the I/O in pF
   $d_{T[LH|HL|HLS]}$ is the worst case delta value from the datasheet in ns/pF.

Table 2-35 • **A54SX72A Timing Characteristics (Worst-Case Commercial Conditions, V_{CCA} = 2.25 V, V_{CCI} = 3.0 V, T_J = 70°C)**

Parameter	Description	–3 Speed[1]		–2 Speed		–1 Speed		Std. Speed		–F Speed		Units
		Min.	Max.	Min.	Max.	Min.	Max.	Min.	Max.	Min.	Max.	
C-Cell Propagation Delays[2]

t_{HD}	Flip-Flop Data Input Hold	0.0		0.0		0.0		0.0		0.0		ns
t_{WASYN}	Asynchronous Pulse Width	1.3		1.5		1.7		2.0		2.8		ns
$t_{RECASYN}$	Asynchronous Recovery Time	0.3		0.4		0.4		0.5		0.7		ns
t_{HASYN}	Asynchronous Hold Time	0.3		0.3		0.3		0.4		0.6		ns
t_{MPW}	Clock Minimum Pulse Width	1.5		1.7		2.0		2.3		3.2		ns
Input Module Propagation Delays												
t_{INYH}	Input Data Pad to Y High 2.5 V LVCMOS		0.6		0.7		0.8		0.9		1.3	ns
t_{INYL}	Input Data Pad to Y Low 2.5 V LVCMOS		0.8		1.0		1.1		1.3		1.7	ns
t_{INYH}	Input Data Pad to Y High 3.3 V PCI		0.6		0.7		0.7		0.9		1.2	ns
t_{INYL}	Input Data Pad to Y Low 3.3 V PCI		0.7		0.8		0.9		1.0		1.4	ns
t_{INYH}	Input Data Pad to Y High 3.3 V LVTTL		0.7		0.7		0.8		1.0		1.4	ns
t_{INYL}	Input Data Pad to Y Low 3.3 V LVTTL		1.0		1.2		1.3		1.5		2.1	ns

Notes:

1. *All –3 speed grades have been discontinued.*
2. *For dual-module macros, use t_{PD} + t_{RD1} + t_{PDn} , t_{RCO} + t_{RD1} + t_{PDn} , or t_{PD1} + t_{RD1} + t_{SUD} , whichever is appropriate.*
3. *Routing delays are for typical designs across worst-case operating conditions. These parameters should be used for estimating device performance. Post-route timing analysis or simulation is required to determine actual performance.*

Table 2-40 • **A54SX72A Timing Characteristics (Worst-Case Commercial Conditions V_{CCA} = 2.25 V, V_{CCI} = 3.0 V, T_J = 70°C)**
