Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Obsolete
Number of LABs/CLBs	2880
Number of Logic Elements/Cells	-
Total RAM Bits	-
Number of I/O	249
Number of Gates	48000
Voltage - Supply	2.25V ~ 5.25V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 85°C (TA)
Package / Case	484-BGA
Supplier Device Package	484-FPBGA (27X27)

Probing Capabilities

SX-A devices also provide an internal probing capability that is accessed with the JTAG pins. The Silicon Explorer II diagnostic hardware is used to control the TDI, TCK, TMS, and TDO pins to select the desired nets for debugging. The user assigns the selected internal nets in Actel Silicon Explorer II software to the PRA/PRB output pins for observation. Silicon Explorer II automatically places the device into JTAG mode. However, probing functionality is only activated when the TRST pin is driven high or left floating, allowing the internal pull-up resistor to pull TRST High. If the TRST pin is held Low, the TAP controller remains in the Test-Logic-Reset state so no probing can be performed. However, the user must drive the TRST pin High or allow the internal pull-up resistor to pull TRST High.

When selecting the **Reserve Probe Pin** box as shown in Figure 1-12 on page 1-9, direct the layout tool to reserve the PRA and PRB pins as dedicated outputs for probing. This **Reserve** option is merely a guideline. If the designer assigns user I/Os to the PRA and PRB pins and selects the **Reserve Probe Pin** option, Designer Layout will override the **Reserve Probe Pin** option and place the user I/Os on those pins.

To allow probing capabilities, the security fuse must not be programmed. Programming the security fuse disables the JTAG and probe circuitry. Table 1-9 summarizes the possible device configurations for probing once the device leaves the Test-Logic-Reset JTAG state.

Table 1-9 • **Device Configuration Options for Probe Capability (TRST Pin Reserved)**

JTAG Mode	TRST[1]	Security Fuse Programmed	PRA, PRB[2]	TDI, TCK, TDO[2]
Dedicated	Low	No	User I/O[3]	JTAG Disabled
	High	No	Probe Circuit Outputs	JTAG I/O
Flexible	Low	No	User I/O[3]	User I/O[3]
	High	No	Probe Circuit Outputs	JTAG I/O
		Yes	Probe Circuit Secured	Probe Circuit Secured

Notes:

1. *If the TRST pin is not reserved, the device behaves according to TRST = High as described in the table.*
2. *Avoid using the TDI, TCK, TDO, PRA, and PRB pins as input or bidirectional ports. Since these pins are active during probing, input signals will not pass through these pins and may cause contention.*
3. *If no user signal is assigned to these pins, they will behave as unused I/Os in this mode. Unused pins are automatically tristated by the Designer software.*

$slew_F$	Output Fall Slew Rate	2.4 V to 0.4 V load [4]	1	5	V/ns

Notes:

1. *Refer to the V/I curves in Figure 2-1 on page 2-5. Switching current characteristics for REQ# and GNT# are permitted to be one half of that specified here; i.e., half size output drivers may be used on these signals. This specification does not apply to CLK and RST#, which are system outputs. "Switching Current High" specifications are not relevant to SERR#, INTA#, INTB#, INTC#, and INTD#, which are open drain outputs.*
2. *Note that this segment of the minimum current curve is drawn from the AC drive point directly to the DC drive point rather than toward the voltage rail (as is done in the pull-down curve). This difference is intended to allow for an optional N-channel pull-up.*
3. *Maximum current requirements must be met as drivers pull beyond the last step voltage. Equations defining these maximums (A and B) are provided with the respective diagrams in Figure 2-1 on page 2-5. The equation defined maximum should be met by design. In order to facilitate component testing, a maximum current test point is defined for each side of the output driver.*
4. *This parameter is to be interpreted as the cumulative edge rate across the specified range, rather than the instantaneous rate at any point within the transition range. The specified load (diagram below) is optional; i.e., the designer may elect to meet this parameter with an unloaded output per revision 2.0 of the PCI Local Bus Specification. However, adherence to both maximum and minimum parameters is now required (the maximum is no longer simply a guideline). Since adherence to the maximum slew rate was not required prior to revision 2.1 of the specification, there may be components in the market for some time that have faster edge rates; therefore, motherboard designers must bear in mind that rise and fall times faster than this specification could occur and should ensure that signal integrity modeling accounts for this. Rise slew rate does not apply to open drain outputs.*

Notes:

1. *This specification should be guaranteed by design. It is the minimum voltage to which pull-up resistors are calculated to pull a floated network. Designers should ensure that the input buffer is conducting minimum current at this input voltage in applications sensitive to static power utilization.*
2. *Input leakage currents include hi-Z output leakage for all bidirectional buffers with tristate outputs.*
3. *Absolute maximum pin capacitance for a PCI input is 10 pF (except for CLK).*

1. *All –3 speed grades have been discontinued.*
2. *For dual-module macros, use $t_{PD} + t_{RD1} + t_{PDn}$, $t_{RCO} + t_{RD1} + t_{PDn}$, or $t_{PD1} + t_{RD1} + t_{SUD}$, whichever is appropriate.*
3. *Routing delays are for typical designs across worst-case operating conditions. These parameters should be used for estimating device performance. Post-route timing analysis or simulation is required to determine actual performance.*

Notes:

1. *All –3 speed grades have been discontinued.*
2. *Delays based on 10 pF loading and 25 Ω resistance.*
3. *To obtain the slew rate, substitute the appropriate Delta value, load capacitance, and the V_{CCI} value into the following equation:*
   Slew Rate [V/ns] = $(0.1*V_{CCI} – 0.9*V_{CCI})/ (C_{load} * d_{T[LH|HL|HLS]})$
   where C_{load} is the load capacitance driven by the I/O in pF
   $d_{T[LH|HL|HLS]}$ is the worst case delta value from the datasheet in ns/pF.
4. *Delays based on 35 pF loading.*
