Microsemi Corporation - A54SX32A-2TQ176I Datasheet

Welcome to **E-XFL.COM**

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Details	
Product Status	Obsolete
Number of LABs/CLBs	2880
Number of Logic Elements/Cells	-
Total RAM Bits	-
Number of I/O	147
Number of Gates	48000
Voltage - Supply	2.25V ~ 5.25V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 85°C (TA)
Package / Case	176-LQFP
Supplier Device Package	176-TQFP (24x24)
Purchase URL	https://www.e-xfl.com/product-detail/microsemi/a54sx32a-2tq176i

Boundary-Scan Testing (BST)

All SX-A devices are IEEE 1149.1 compliant and offer superior diagnostic and testing capabilities by providing Boundary Scan Testing (BST) and probing capabilities. The BST function is controlled through the special JTAG pins (TMS, TDI, TCK, TDO, and TRST). The functionality of the JTAG pins is defined by two available modes: Dedicated and Flexible. TMS cannot be employed as a user I/O in either mode.

Dedicated Mode

In Dedicated mode, all JTAG pins are reserved for BST; designers cannot use them as regular I/Os. An internal pull-up resistor is automatically enabled on both TMS and TDI pins, and the TMS pin will function as defined in the IEEE 1149.1 (JTAG) specification.

To select Dedicated mode, the user must reserve the JTAG pins in Actel's Designer software. Reserve the JTAG pins by checking the **Reserve JTAG** box in the Device Selection Wizard (Figure 1-12).

The default for the software is Flexible mode; all boxes are unchecked. Table 1-5 lists the definitions of the options in the Device Selection Wizard.

Figure 1-12 • **Device Selection Wizard**

Table 1-5 • **Reserve Pin Definitions**

Pin	Function
Reserve JTAG	Keeps pins from being used and changes the behavior of JTAG pins (no pull-up on TMS)
Reserve JTAG Test Reset	Regular I/O or JTAG reset with an internal pull-up
Reserve Probe	Keeps pins from being used or regular I/O

Flexible Mode

In Flexible mode, TDI, TCK, and TDO may be employed as either user I/Os or as JTAG input pins. The internal resistors on the TMS and TDI pins are not present in flexible JTAG mode.

To select the Flexible mode, uncheck the **Reserve JTAG** box in the Device Selection Wizard dialog in the Actel Designer software. In Flexible mode, TDI, TCK, and TDO pins may function as user I/Os or BST pins. The functionality is controlled by the BST Test Access Port (TAP) controller. The TAP controller receives two control inputs, TMS and TCK. Upon power-up, the TAP controller enters the Test-Logic-Reset state. In this state, TDI, TCK, and TDO function as user I/Os. The TDI, TCK, and TDO are transformed from user I/Os into BST pins when a rising edge on TCK is detected while TMS is at logic low. To return to Test-Logic Reset state, TMS must be high for at least five TCK cycles. **An external 10 k pull-up resistor to V_{CCI} should be placed on the TMS pin to pull it High by default.**

Table 1-6 describes the different configuration requirements of BST pins and their functionality in different modes.

Table 1-6 • **Boundary-Scan Pin Configurations and Functions**

Mode	Designer "Reserve JTAG" Selection	TAP Controller State
Dedicated (JTAG)	Checked	Any
Flexible (User I/O)	Unchecked	Test-Logic-Reset
Flexible (JTAG)	Unchecked	Any EXCEPT Test-Logic-Reset

TRST Pin

The TRST pin functions as a dedicated Boundary-Scan Reset pin when the **Reserve JTAG Test Reset** option is selected as shown in Figure 1-12. An internal pull-up resistor is permanently enabled on the TRST pin in this mode. Actel recommends connecting this pin to ground in normal operation to keep the JTAG state controller in the Test-Logic-Reset state. When JTAG is being used, it can be left floating or can be driven high.

When the **Reserve JTAG Test Reset** option is not selected, this pin will function as a regular I/O. If unused as an I/O in the design, it will be configured as a tristated output.

SX-A Probe Circuit Control Pins

SX-A devices contain internal probing circuitry that provides built-in access to every node in a design, enabling 100% real-time observation and analysis of a device's internal logic nodes without design iteration. The probe circuitry is accessed by Silicon Explorer II, an easy to use, integrated verification and logic analysis tool that can sample data at 100 MHz (asynchronous) or 66 MHz (synchronous). Silicon Explorer II attaches to a PC's standard COM port, turning the PC into a fully functional 18-channel logic analyzer. Silicon Explorer II allows designers to complete the design verification process at their desks and reduces verification time from several hours per cycle to a few seconds.

The Silicon Explorer II tool uses the boundary-scan ports (TDI, TCK, TMS, and TDO) to select the desired nets for verification. The selected internal nets are assigned to the PRA/PRB pins for observation. Figure 1-13 illustrates the interconnection between Silicon Explorer II and the FPGA to perform in-circuit verification.

Design Considerations

In order to preserve device probing capabilities, users should avoid using the TDI, TCK, TDO, PRA, and PRB pins as input or bidirectional ports. Since these pins are active during probing, critical input signals through these pins are not available. In addition, the security fuse must not be programmed to preserve probing capabilities. Actel recommends that you use a 70 Ω series termination resistor on every probe connector (TDI, TCK, TMS, TDO, PRA, PRB). The 70 Ω series termination is used to prevent data transmission corruption during probing and reading back the checksum.

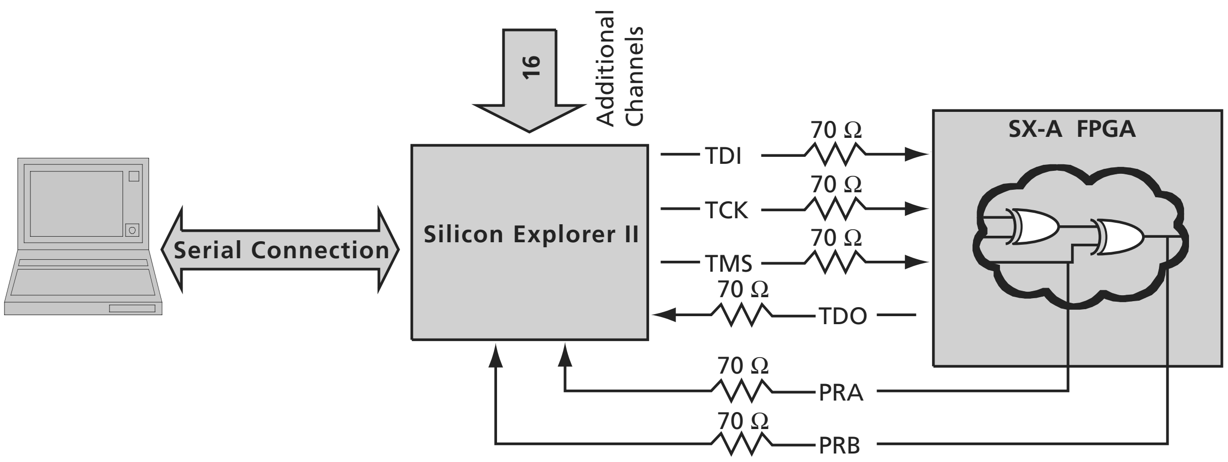

Figure 1-13 • **Probe Setup**

Where:

C_{EQCM} = Equivalent capacitance of combinatorial modules (C-cells) in pF

C_{EQSM} = Equivalent capacitance of sequential modules (R-Cells) in pF

C_{EQI} = Equivalent capacitance of input buffers in pF

C_{EQO} = Equivalent capacitance of output buffers in pF

C_{EQCR} = Equivalent capacitance of CLKA/B in pF

C_{EQHV} = Variable capacitance of HCLK in pF

C_{EQHF} = Fixed capacitance of HCLK in pF

$C_{L =}$ Output lead capacitance in pF

f_m = Average logic module switching rate in MHz

f_n = Average input buffer switching rate in MHz

f_p = Average output buffer switching rate in MHz

f_{q1} = Average CLKA rate in MHz

f_{q2} = Average CLKB rate in MHz

f_{s1} = Average HCLK rate in MHz

m = Number of logic modules switching at fm

n = Number of input buffers switching at fn

p = Number of output buffers switching at fp

q_1 = Number of clock loads on CLKA

q_2 = Number of clock loads on CLKB

r_1 = Fixed capacitance due to CLKA

r_2 = Fixed capacitance due to CLKB

$s_{1 =}$ Number of clock loads on HCLK

x = Number of I/Os at logic low

y = Number of I/Os at logic high

Table 2-11 • **CEQ Values for SX-A Devices**

	A54SX08A	**A54SX16A**	**A54SX32A**	**A54SX72A**

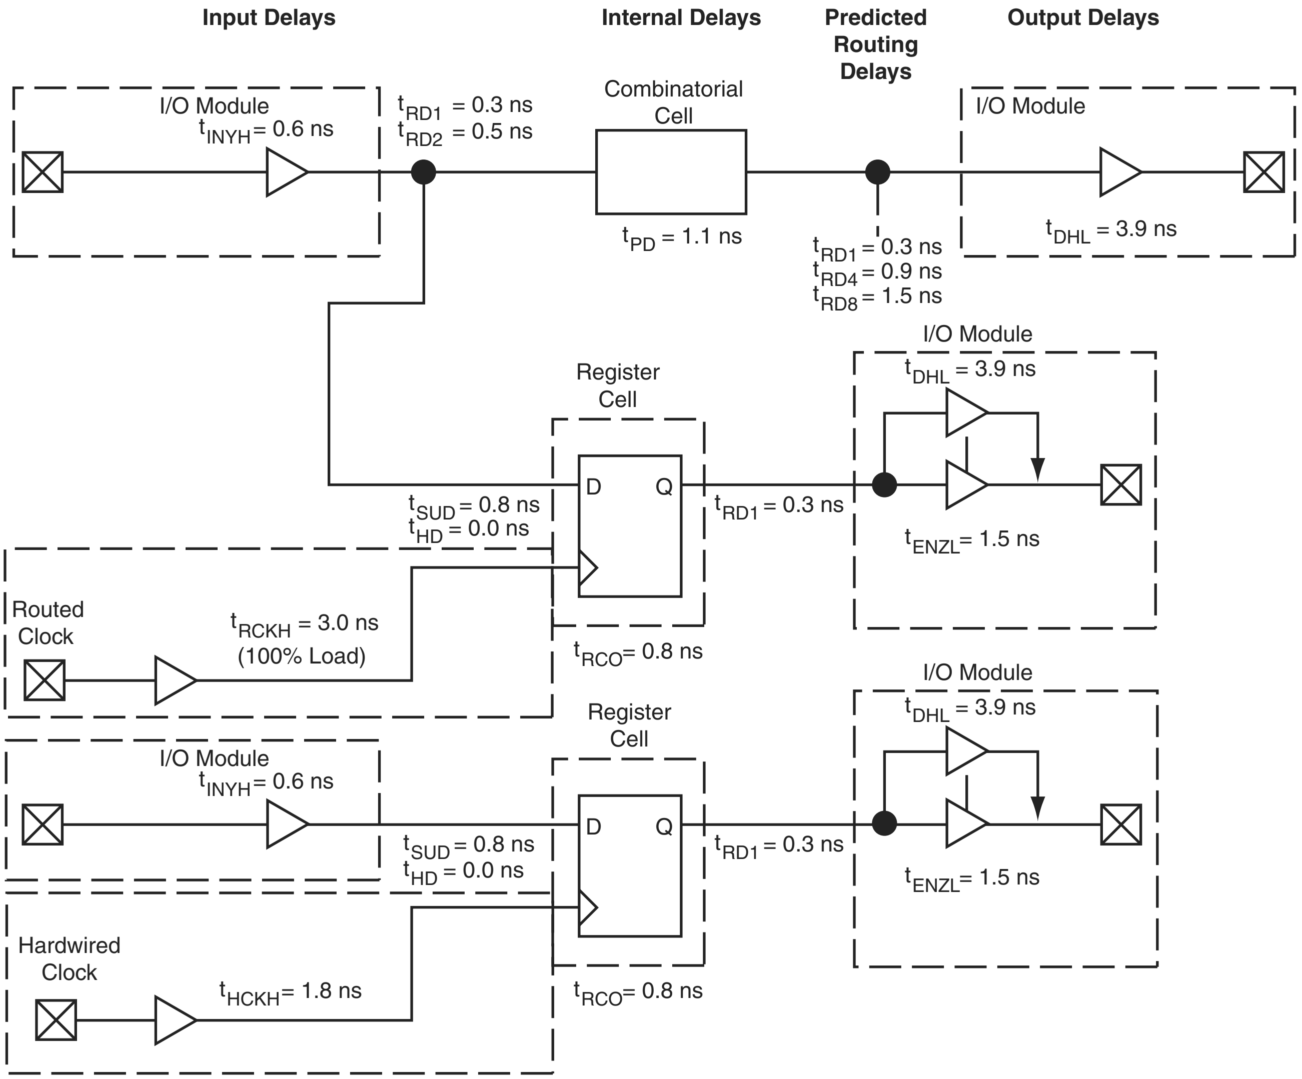
SX-A Timing Model



Note: _*Values shown for A54SX72A, –2, worst-case commercial conditions at 5 V PCI with standard place-and-route._

Figure 2-3 • **SX-A Timing Model**

Sample Path Calculations

Hardwired Clock

External Setup = $(t_{INYH} + t_{RD1} + t_{SUD}) - t_{HCKH}$
= $0.6 + 0.3 + 0.8 - 1.8 = -0.1$ ns

Clock-to-Out (Pad-to-Pad) = $t_{HCKH} + t_{RCO} + t_{RD1} + t_{DHL}$
= $1.8 + 0.8 + 0.3 + 3.9 = 6.8$ ns

Routed Clock

External Setup = $(t_{INYH} + t_{RD1} + t_{SUD}) - t_{RCKH}$
= $0.6 + 0.3 + 0.8 - 3.0 = -1.3$ ns

Clock-to-Out (Pad-to-Pad) = $t_{RCKH} + t_{RCO} + t_{RD1} + t_{DHL}$
= $3.0 + 0.8 + 0.3 + 3.9 = 8.0$ ns

Timing Characteristics

Timing characteristics for SX-A devices fall into three categories: family-dependent, device-dependent, and design-dependent. The input and output buffer characteristics are common to all SX-A family members. Internal routing delays are device-dependent. Design dependency means actual delays are not determined until after placement and routing of the user's design are complete. The timing characteristics listed in this datasheet represent sample timing numbers of the SX-A devices. Design-specific delay values may be determined by using Timer or performing simulation after successful place-and-route with the Designer software.

Critical Nets and Typical Nets

Propagation delays are expressed only for typical nets, which are used for initial design performance evaluation. Critical net delays can then be applied to the most timing-critical paths. Critical nets are determined by net property assignment prior to placement and routing. Up to 6 percent of the nets in a design may be designated as critical, while 90 percent of the nets in a design are typical.

Long Tracks

Some nets in the design use long tracks. Long tracks are special routing resources that span multiple rows, columns, or modules. Long tracks employ three to five antifuse connections. This increases capacitance and resistance, resulting in longer net delays for macros connected to long tracks. Typically, up to 6 percent of nets in a fully utilized device require long tracks. Long tracks contribute approximately 4 ns to 8.4 ns delay. This additional delay is represented statistically in higher fanout routing delays.

Timing Derating

SX-A devices are manufactured with a CMOS process. Therefore, device performance varies according to temperature, voltage, and process changes. Minimum timing parameters reflect maximum operating voltage, minimum operating temperature, and best-case processing. Maximum timing parameters reflect minimum operating voltage, maximum operating temperature, and worst-case processing.

Temperature and Voltage Derating Factors

Table 2-13 • **Temperature and Voltage Derating Factors (Normalized to Worst-Case Commercial, T_J = 70°C, V_{CCA} = 2.25 V)**

V_{CCA}	Junction Temperature (T_J)						
	–55°C	**–40°C**	**0°C**	**25°C**	**70°C**	**85°C**	**125°C**
2.250 V	0.79	0.80	0.87	0.89	1.00	1.04	1.14
2.500 V	0.74	0.75	0.82	0.83	0.94	0.97	1.07
2.750 V	0.68	0.69	0.75	0.77	0.87	0.90	0.99

d_{THLS}[4]	Delta High to Low—low slew		0.057		0.06		0.071		0.086		0.117	ns/pF

Note:

1. *All –3 speed grades have been discontinued.*
2. *Delays based on 35 pF loading.*
3. *The equivalent IO Attribute settings for 2.5 V LVCMOS is 2.5 V LVTTL in the software.*
4. *To obtain the slew rate, substitute the appropriate Delta value, load capacitance, and the V_{CCI} value into the following equation:*
   Slew Rate [V/ns] = $(0.1*V_{CCI} – 0.9*V_{CCI})/ (C_{load} * d_{T[LH|HL|HLS]})$
   where C_{load} is the load capacitance driven by the I/O in pF
   $d_{T[LH|HL|HLS]}$ is the worst case delta value from the datasheet in ns/pF.

Table 2-33 • **A54SX32A Timing Characteristics**
(Worst-Case Commercial Conditions V_{CCA} = 2.25 V, V_{CCI} = 3.0 V, T_J = 70°C)

Parameter	Description	–3 Speed[1]		–2 Speed		–1 Speed		Std. Speed		–F Speed		Units
