### Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

#### Details

## Boundary-Scan Testing (BST)

All SX-A devices are IEEE 1149.1 compliant and offer superior diagnostic and testing capabilities by providing Boundary Scan Testing (BST) and probing capabilities. The BST function is controlled through the special JTAG pins (TMS, TDI, TCK, TDO, and TRST). The functionality of the JTAG pins is defined by two available modes: Dedicated and Flexible. TMS cannot be employed as a user I/O in either mode.

### Dedicated Mode

In Dedicated mode, all JTAG pins are reserved for BST; designers cannot use them as regular I/Os. An internal pull-up resistor is automatically enabled on both TMS and TDI pins, and the TMS pin will function as defined in the IEEE 1149.1 (JTAG) specification.

To select Dedicated mode, the user must reserve the JTAG pins in Actel's Designer software. Reserve the JTAG pins by checking the **Reserve JTAG** box in the Device Selection Wizard (Figure 1-12).

The default for the software is Flexible mode; all boxes are unchecked. Table 1-5 lists the definitions of the options in the Device Selection Wizard.

Figure 1-12 • Device Selection Wizard

Table 1-5 • Reserve Pin Definitions

| Pin                     | Function                                                                             |
|-------------------------|--------------------------------------------------------------------------------------|
| Reserve JTAG            | Keeps pins from being used and changes the behavior of JTAG pins (no pull-up on TMS) |
| Reserve JTAG Test Reset | Regular I/O or JTAG reset with an internal pull-up                                   |
| Reserve Probe           | Keeps pins from being used or regular I/O                                            |

### Flexible Mode

In Flexible mode, TDI, TCK, and TDO may be employed as either user I/Os or as JTAG input pins. The internal resistors on the TMS and TDI pins are not present in flexible JTAG mode.

To select the Flexible mode, uncheck the **Reserve JTAG** box in the Device Selection Wizard dialog in the Actel Designer software. In Flexible mode, TDI, TCK, and TDO pins may function as user I/Os or BST pins. The functionality is controlled by the BST Test Access Port (TAP) controller. The TAP controller receives two control inputs, TMS and TCK. Upon power-up, the TAP controller enters the Test-Logic-Reset state. In this state, TDI, TCK, and TDO function as user I/Os. The TDI, TCK, and TDO are transformed from user I/Os into BST pins when a rising edge on TCK is detected while TMS is at logic low. To return to Test-Logic Reset state, TMS must be high for at least five TCK cycles. **An external 10 k pull-up resistor to V<sub>CC</sub> should be placed on the TMS pin to pull it High by default.**

Table 1-6 describes the different configuration requirements of BST pins and their functionality in different modes.

Table 1-6 • Boundary-Scan Pin Configurations and Functions

| Mode                | Designer "Reserve JTAG" Selection | TAP Controller State        |
|---------------------|-----------------------------------|-----------------------------|
| Dedicated (JTAG)    | Checked                           | Any                         |
| Flexible (User I/O) | Unchecked                         | Test-Logic-Reset            |
| Flexible (JTAG)     | Unchecked                         | Any EXCEPT Test-Logic-Reset |

### TRST Pin

The TRST pin functions as a dedicated Boundary-Scan Reset pin when the **Reserve JTAG Test Reset** option is selected as shown in Figure 1-12. An internal pull-up resistor is permanently enabled on the TRST pin in this mode. Actel recommends connecting this pin to ground in normal operation to keep the JTAG state controller in the Test-Logic-Reset state. When JTAG is being used, it can be left floating or can be driven high.

When the **Reserve JTAG Test Reset** option is not selected, this pin will function as a regular I/O. If unused as an I/O in the design, it will be configured as a tristated output.

# Detailed Specifications

## Operating Conditions

Table 2-1 • Absolute Maximum Ratings

| Symbol    | Parameter                    | Limits                    | Units |
|-----------|------------------------------|---------------------------|-------|
| $V_{CCI}$ | DC Supply Voltage for I/Os   | −0.3 to +6.0              | V     |
| $V_{CCA}$ | DC Supply Voltage for Arrays | −0.3 to +3.0              | V     |
| $V_I$     | Input Voltage                | −0.5 to +5.75             | V     |
| $V_O$     | Output Voltage               | −0.5 to + $V_{CCI}$ + 0.5 | V     |
| $T_{STG}$ | Storage Temperature          | −65 to +150               | °C    |

**Note:** \*Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. Exposure to absolute maximum rated conditions for extended periods may affect device reliability. Devices should not be operated outside the "Recommended Operating Conditions".

Table 2-2 • Recommended Operating Conditions

| Parameter                                            | Commercial   | Industrial   | Units |
|------------------------------------------------------|--------------|--------------|-------|
| Temperature Range                                    | 0 to +70     | −40 to +85   | °C    |
| 2.5 V Power Supply Range ( $V_{CCA}$ and $V_{CCI}$ ) | 2.25 to 2.75 | 2.25 to 2.75 | V     |
| 3.3 V Power Supply Range ( $V_{CCI}$ )               | 3.0 to 3.6   | 3.0 to 3.6   | V     |
| 5 V Power Supply Range ( $V_{CCI}$ )                 | 4.75 to 5.25 | 4.75 to 5.25 | V     |

## Typical SX-A Standby Current

Table 2-3 • Typical Standby Current for SX-A at 25°C with  $V_{CCA} = 2.5$  V

| Product  | $V_{CCI} = 2.5$ V | $V_{CCI} = 3.3$ V | $V_{CCI} = 5$ V |
|----------|-------------------|-------------------|-----------------|
| A54SX08A | 0.8 mA            | 1.0 mA            | 2.9 mA          |
| A54SX16A | 0.8 mA            | 1.0 mA            | 2.9 mA          |
| A54SX32A | 0.9 mA            | 1.0 mA            | 3.0 mA          |
| A54SX72A | 3.6 mA            | 3.8 mA            | 4.5 mA          |

Table 2-4 • Supply Voltages

| $V_{CCA}$ | $V_{CCI}^*$ | Maximum Input Tolerance | Maximum Output Drive |
|-----------|-------------|-------------------------|----------------------|
| 2.5 V     | 2.5 V       | 5.75 V                  | 2.7 V                |
| 2.5 V     | 3.3 V       | 5.75 V                  | 3.6 V                |
| 2.5 V     | 5 V         | 5.75 V                  | 5.25 V               |

**Note:** \*3.3 V PCI is not 5 V tolerant due to the clamp diode, but instead is 3.3 V tolerant.

## Theta-JA

Junction-to-ambient thermal resistance ( $\theta_{JA}$ ) is determined under standard conditions specified by JESD-51 series but has little relevance in actual performance of the product in real application. It should be employed with caution but is useful for comparing the thermal performance of one package to another.

A sample calculation to estimate the absolute maximum power dissipation allowed (worst case) for a 329-pin PBGA package at still air is as follows. i.e.:

$\theta_{JA} = 17.1^\circ\text{C/W}$  is taken from [Table 2-12 on page 2-11](#)

$T_A = 125^\circ\text{C}$  is the maximum limit of ambient (from the datasheet)

$$\text{Max. Allowed Power} = \frac{\text{Max Junction Temp} - \text{Max. Ambient Temp}}{\theta_{JA}} = \frac{150^\circ\text{C} - 125^\circ\text{C}}{17.1^\circ\text{C/W}} = 1.46 \text{ W}$$

EQ 2-11

The device's power consumption must be lower than the calculated maximum power dissipation by the package.

The power consumption of a device can be calculated using the Actel power calculator. If the power consumption is higher than the device's maximum allowable power dissipation, then a heat sink can be attached on top of the case or the airflow inside the system must be increased.

## Theta-JC

Junction-to-case thermal resistance ( $\theta_{JC}$ ) measures the ability of a device to dissipate heat from the surface of the chip to the top or bottom surface of the package. It is applicable for packages used with external heat sinks and only applies to situations where all or nearly all of the heat is dissipated through the surface in consideration. If the power consumption is higher than the calculated maximum power dissipation of the package, then a heat sink is required.

## Calculation for Heat Sink

For example, in a design implemented in a FG484 package, the power consumption value using the power calculator is 3.00 W. The user-dependent data  $T_J$  and  $T_A$  are given as follows:

$T_J = 110^\circ\text{C}$

$T_A = 70^\circ\text{C}$

From the datasheet:

$\theta_{JA} = 18.0^\circ\text{C/W}$

$\theta_{JC} = 3.2^\circ\text{C/W}$

$$P = \frac{\text{Max Junction Temp} - \text{Max. Ambient Temp}}{\theta_{JA}} = \frac{110^\circ\text{C} - 70^\circ\text{C}}{18.0^\circ\text{C/W}} = 2.22 \text{ W}$$

EQ 2-12

The 2.22 W power is less than then required 3.00 W; therefore, the design requires a heat sink or the airflow where the device is mounted should be increased. The design's junction-to-air thermal resistance requirement can be estimated by:

$$\theta_{JA} = \frac{\text{Max Junction Temp} - \text{Max. Ambient Temp}}{P} = \frac{110^\circ\text{C} - 70^\circ\text{C}}{3.00 \text{ W}} = 13.33^\circ\text{C/W}$$

EQ 2-13

## Timing Characteristics

Table 2-14 • A54SX08A Timing Characteristics  
(Worst-Case Commercial Conditions,  $V_{CCA} = 2.25\text{ V}$ ,  $V_{CCI} = 3.0\text{ V}$ ,  $T_J = 70^\circ\text{C}$ )

| Parameter                              | Description                           | –2 Speed |      | –1 Speed |      | Std. Speed |      | –F Speed |      | Units |

**Note:**

- Delays based on 35 pF loading.
- The equivalent I/O Attribute Editor settings for 2.5 V LVCMOS is 2.5 V LVTTTL in the software.
- To obtain the slew rate, substitute the appropriate Delta value, load capacitance, and the  $V_{CCI}$  value into the following equation:  

$$\text{Slew Rate [V/ns]} = (0.1 * V_{CCI} - 0.9 * V_{CCI}) / (C_{load} * d_{T[HL|HL|HLS]})$$
where  $C_{load}$  is the load capacitance driven by the I/O in pF  
 $d_{T[HL|HL|HLS]}$  is the worst case delta value from the datasheet in ns/pF.

**Notes:**

1. All –3 speed grades have been discontinued.
2. Delays based on 10 pF loading and 25  $\Omega$  resistance.
3. To obtain the slew rate, substitute the appropriate Delta value, load capacitance, and the  $V_{CCI}$  value into the following equation:  

$$\text{Slew Rate [V/ns]} = (0.1 * V_{CCI} - 0.9 * V_{CCI}) / (C_{load} * d_{T[HL|HL|HLS]})$$
 where  $C_{load}$  is the load capacitance driven by the I/O in pF  
 $d_{T[HL|HL|HLS]}$  is the worst case delta value from the datasheet in ns/pF.
4. Delays based on 35 pF loading.

**Note:**

1. All –3 speed grades have been discontinued.
2. Delays based on 35 pF loading.
3. The equivalent IO Attribute settings for 2.5 V LVCMOS is 2.5 V LVTTTL in the software.
4. To obtain the slew rate, substitute the appropriate Delta value, load capacitance, and the  $V_{CCI}$  value into the following equation:  

$$\text{Slew Rate [V/ns]} = (0.1 * V_{CCI} - 0.9 * V_{CCI}) / (C_{load} * d_{T[LH|HL|HLS]})$$
where  $C_{load}$  is the load capacitance driven by the I/O in pF  
 $d_{T[LH|HL|HLS]}$  is the worst case delta value from the datasheet in ns/pF.

**Notes:**

1. All –3 speed grades have been discontinued.
2. Delays based on 10 pF loading and 25  $\Omega$  resistance.
3. To obtain the slew rate, substitute the appropriate Delta value, load capacitance, and the  $V_{CCI}$  value into the following equation:  

$$\text{Slew Rate [V/ns]} = (0.1 * V_{CCI} - 0.9 * V_{CCI}) / (C_{load} * d_{T[HL|HL|HLS]})$$
 where  $C_{load}$  is the load capacitance driven by the I/O in pF  
 $d_{T[HL|HL|HLS]}$  is the worst case delta value from the datasheet in ns/pF.
4. Delays based on 35 pF loading.

Table 2-41 • **A54SX72A Timing Characteristics**  
(Worst-Case Commercial Conditions  $V_{CCA} = 2.25\text{ V}$ ,  $V_{CCI} = 4.75\text{ V}$ ,  $T_J = 70^\circ\text{C}$ )
