Welcome to **E-XFL.COM**

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Details	
Product Status	Active
Number of LABs/CLBs	2880
Number of Logic Elements/Cells	-
Total RAM Bits	-
Number of I/O	203
Number of Gates	48000
Voltage - Supply	2.25V ~ 5.25V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 125°C (TA)
Package / Case	256-BGA
Supplier Device Package	256-FPBGA (17x17)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/a54sx32a-fg256a

Email: info@E-XFL.COM
Address: Room A, 16/F, Full Win Commercial Centre, 573 Nathan Road, Mongkok, Hong Kong

Datasheet Information

General Description

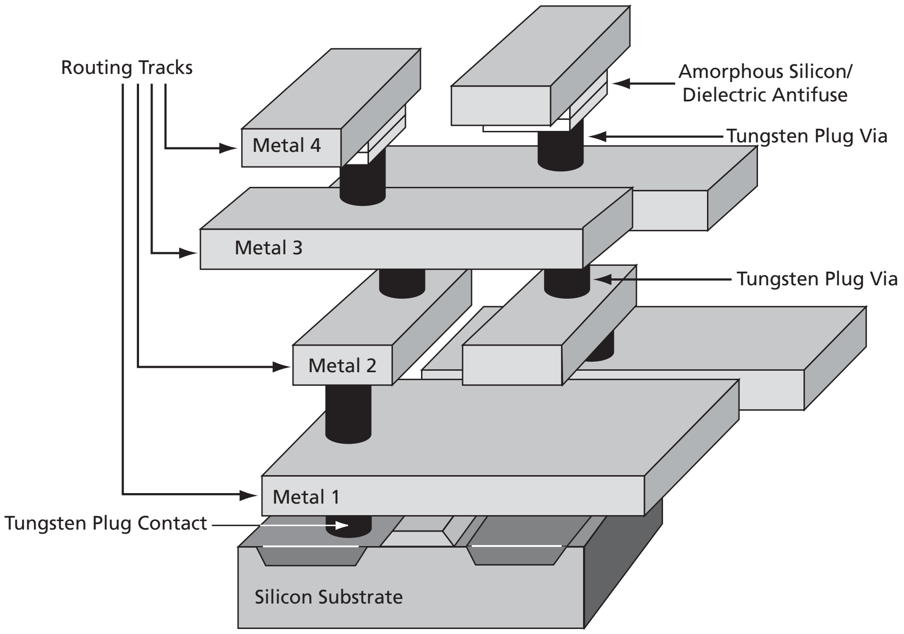
Introduction

The Actel SX-A family of FPGAs offers a cost-effective, single-chip solution for low-power, high-performance designs. Fabricated on 0.22 µm / 0.25 µm CMOS antifuse technology and with the support of 2.5 V, 3.3 V and 5 V I/Os, the SX-A is a versatile platform to integrate designs while significantly reducing time-to-market.

SX-A Family Architecture

The SX-A family's device architecture provides a unique approach to module organization and chip routing that satisfies performance requirements and delivers the most optimal register/logic mix for a wide variety of applications.

Interconnection between these logic modules is achieved using Actel's patented metal-to-metal programmable antifuse interconnect elements (Figure 1-1). The antifuses are normally open circuit and, when programmed, form a permanent low-impedance connection.



Note: *The A54SX72A device has four layers of metal with the antifuse between Metal 3 and Metal 4. The A54SX08A, A54SX16A, and A54SX32A devices have three layers of metal with the antifuse between Metal 2 and Metal 3.*

Figure 1-1 • **SX-A Family Interconnect Elements**

Power-Up/Down and Hot Swapping

SX-A I/Os are configured to be hot-swappable, with the exception of 3.3 V PCI. During power-up/down (or partial up/down), all I/Os are tristated. V_{CCA} and V_{CCI} do not have to be stable during power-up/down, and can be powered up/down in any order. When the SX-A device is plugged into an electrically active system, the device will not degrade the reliability of or cause damage to the host system. The device's output pins are driven to a high impedance state until normal chip operating conditions are reached. Table 1-4 summarizes the V_{CCA} voltage at which the I/Os behave according to the user's design for an SX-A device at room temperature for various ramp-up rates. The data reported assumes a linear ramp-up profile to 2.5 V. For more information on power-up and hot-swapping, refer to the application note, *Actel SX-A and RT54SX-S Devices in Hot-Swap and Cold-Sparing Applications*.

Table 1-2 • **I/O Features**

Function	**Description**
Input Buffer Threshold Selections	• 5 V: PCI, TTL • 3.3 V: PCI, LVTTL • 2.5 V: LVCMOS2 (commercial only)
Flexible Output Driver	• 5 V: PCI, TTL • 3.3 V: PCI, LVTTL • 2.5 V: LVCMOS2 (commercial only)
Output Buffer	"Hot-Swap" Capability (3.3 V PCI is not hot swappable) • I/O on an unpowered device does not sink current • Can be used for "cold-sparing" Selectable on an individual I/O basis Individually selectable slew rate; high slew or low slew (The default is high slew rate). The slew is only affected on the falling edge of an output. Rising edges of outputs are not affected.
Power-Up	Individually selectable pull-ups and pull-downs during power-up (default is to power-up in tristate) Enables deterministic power-up of device V_{CCA} and V_{CCI} can be powered in any order

Table 1-3 • **I/O Characteristics for All I/O Configurations**

	Hot Swappable	**Slew Rate Control**	**Power-Up Resistor**
TTL, LVTTL, LVCMOS2	Yes	Yes. Only affects falling edges of outputs	Pull-up or pull-down
3.3 V PCI	No	No. High slew rate only	Pull-up or pull-down
5 V PCI	Yes	No. High slew rate only	Pull-up or pull-down

Table 1-4 • **Power-Up Time at which I/Os Become Active**

Supply Ramp Rate	**0.25 V/µs**	**0.025 V/µs**	**5 V/ms**	**2.5 V/ms**	**0.5 V/ms**	**0.25 V/ms**	**0.1 V/ms**	**0.025 V/ms**
Units	**µs**	**µs**	**ms**	**ms**	**ms**	**ms**	**ms**	**ms**
A54SX08A	10	96	0.34	0.65	2.7	5.4	12.9	50.8
A54SX16A	10	100	0.36	0.62	2.5	4.7	11.0	41.6
A54SX32A	10	100	0.46	0.74	2.8	5.2	12.1	47.2
A54SX72A	10	100	0.41	0.67	2.6	5.0	12.1	47.2

Boundary-Scan Testing (BST)

All SX-A devices are IEEE 1149.1 compliant and offer superior diagnostic and testing capabilities by providing Boundary Scan Testing (BST) and probing capabilities. The BST function is controlled through the special JTAG pins (TMS, TDI, TCK, TDO, and TRST). The functionality of the JTAG pins is defined by two available modes: Dedicated and Flexible. TMS cannot be employed as a user I/O in either mode.

Dedicated Mode

In Dedicated mode, all JTAG pins are reserved for BST; designers cannot use them as regular I/Os. An internal pull-up resistor is automatically enabled on both TMS and TDI pins, and the TMS pin will function as defined in the IEEE 1149.1 (JTAG) specification.

To select Dedicated mode, the user must reserve the JTAG pins in Actel's Designer software. Reserve the JTAG pins by checking the **Reserve JTAG** box in the Device Selection Wizard (Figure 1-12).

The default for the software is Flexible mode; all boxes are unchecked. Table 1-5 lists the definitions of the options in the Device Selection Wizard.

Device Selection Wizard - Variations

Reserve Pins

☑ Reserve JTAG

☑ Reserve JTAG Test Reset

☑ Reserve Probe

Figure 1-12 • **Device Selection Wizard**

Table 1-5 • **Reserve Pin Definitions**

Pin	Function
Reserve JTAG	Keeps pins from being used and changes the behavior of JTAG pins (no pull-up on TMS)
Reserve JTAG Test Reset	Regular I/O or JTAG reset with an internal pull-up
Reserve Probe	Keeps pins from being used or regular I/O

Flexible Mode

In Flexible mode, TDI, TCK, and TDO may be employed as either user I/Os or as JTAG input pins. The internal resistors on the TMS and TDI pins are not present in flexible JTAG mode.

To select the Flexible mode, uncheck the **Reserve JTAG** box in the Device Selection Wizard dialog in the Actel Designer software. In Flexible mode, TDI, TCK, and TDO pins may function as user I/Os or BST pins. The functionality is controlled by the BST Test Access Port (TAP) controller. The TAP controller receives two control inputs, TMS and TCK. Upon power-up, the TAP controller enters the Test-Logic-Reset state. In this state, TDI, TCK, and TDO function as user I/Os. The TDI, TCK, and TDO are transformed from user I/Os into BST pins when a rising edge on TCK is detected while TMS is at logic low. To return to Test-Logic Reset state, TMS must be high for at least five TCK cycles. **An external 10 k pull-up resistor to V_{CCI} should be placed on the TMS pin to pull it High by default.**

Table 1-6 describes the different configuration requirements of BST pins and their functionality in different modes.

Table 1-6 • **Boundary-Scan Pin Configurations and Functions**

Mode	Designer "Reserve JTAG" Selection	TAP Controller State
Dedicated (JTAG)	Checked	Any
Flexible (User I/O)	Unchecked	Test-Logic-Reset
Flexible (JTAG)	Unchecked	Any EXCEPT Test-Logic-Reset

TRST Pin

The TRST pin functions as a dedicated Boundary-Scan Reset pin when the **Reserve JTAG Test Reset** option is selected as shown in Figure 1-12. An internal pull-up resistor is permanently enabled on the TRST pin in this mode. Actel recommends connecting this pin to ground in normal operation to keep the JTAG state controller in the Test-Logic-Reset state. When JTAG is being used, it can be left floating or can be driven high.

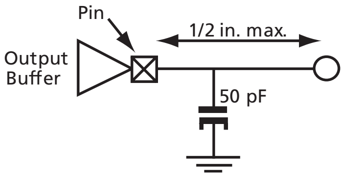
When the **Reserve JTAG Test Reset** option is not selected, this pin will function as a regular I/O. If unused as an I/O in the design, it will be configured as a tristated output.

Table 2-8 • **AC Specifications (5 V PCI Operation)**

Symbol	Parameter	Condition	Min.	Max.	Units
$I_{OH(AC)}$	Switching Current High	$0 < V_{OUT} \le 1.4$ [1]	–44	–	mA
		$1.4 \le V_{OUT} < 2.4$ [1, 2]	$(-44 + (V_{OUT} - 1.4)/0.024)$	–	mA
		$3.1 < V_{OUT} < V_{CCI}$ [1, 3]	–	EQ 2-1 on page 2-5	–
	(Test Point)	$V_{OUT} = 3.1$ [3]	–	–142	mA
$I_{OL(AC)}$	Switching Current Low	$V_{OUT} \ge 2.2$ [1]	95	–	mA
		$2.2 > V_{OUT} > 0.55$ [1]	$(V_{OUT}/0.023)$	–	mA
		$0.71 > V_{OUT} > 0$ [1, 3]	–	EQ 2-2 on page 2-5	–
	(Test Point)	$V_{OUT} = 0.71$ [3]	–	206	mA
I_{CL}	Low Clamp Current	$-5 < V_{IN} \le -1$	$-25 + (V_{IN} + 1)/0.015$	–	mA
$slew_R$	Output Rise Slew Rate	0.4 V to 2.4 V load [4]	1	5	V/ns
$slew_F$	Output Fall Slew Rate	2.4 V to 0.4 V load [4]	1	5	V/ns

Notes:

1. *Refer to the V/I curves in Figure 2-1 on page 2-5. Switching current characteristics for REQ# and GNT# are permitted to be one half of that specified here; i.e., half size output drivers may be used on these signals. This specification does not apply to CLK and RST#, which are system outputs. "Switching Current High" specifications are not relevant to SERR#, INTA#, INTB#, INTC#, and INTD#, which are open drain outputs.*
2. *Note that this segment of the minimum current curve is drawn from the AC drive point directly to the DC drive point rather than toward the voltage rail (as is done in the pull-down curve). This difference is intended to allow for an optional N-channel pull-up.*
3. *Maximum current requirements must be met as drivers pull beyond the last step voltage. Equations defining these maximums (A and B) are provided with the respective diagrams in Figure 2-1 on page 2-5. The equation defined maximum should be met by design. In order to facilitate component testing, a maximum current test point is defined for each side of the output driver.*
4. *This parameter is to be interpreted as the cumulative edge rate across the specified range, rather than the instantaneous rate at any point within the transition range. The specified load (diagram below) is optional; i.e., the designer may elect to meet this parameter with an unloaded output per revision 2.0 of the PCI Local Bus Specification. However, adherence to both maximum and minimum parameters is now required (the maximum is no longer simply a guideline). Since adherence to the maximum slew rate was not required prior to revision 2.1 of the specification, there may be components in the market for some time that have faster edge rates; therefore, motherboard designers must bear in mind that rise and fall times faster than this specification could occur and should ensure that signal integrity modeling accounts for this. Rise slew rate does not apply to open drain outputs.*



Power Dissipation

A critical element of system reliability is the ability of electronic devices to safely dissipate the heat generated during operation. The thermal characteristics of a circuit depend on the device and package used, the operating temperature, the operating current, and the system's ability to dissipate heat.

A complete power evaluation should be performed early in the design process to help identify potential heat-related problems in the system and to prevent the system from exceeding the device’s maximum allowed junction temperature.

The actual power dissipated by most applications is significantly lower than the power the package can dissipate. However, a thermal analysis should be performed for all projects. To perform a power evaluation, follow these steps:

1. Estimate the power consumption of the application.
2. Calculate the maximum power allowed for the device and package.
3. Compare the estimated power and maximum power values.

Estimating Power Dissipation

The total power dissipation for the SX-A family is the sum of the DC power dissipation and the AC power dissipation:

$$P_{Total} = P_{DC} + P_{AC}$$

EQ 2-5

DC Power Dissipation

The power due to standby current is typically a small component of the overall power. An estimation of DC power dissipation under typical conditions is given by:

$$P_{DC} = I_{Standby} * V_{CCA}$$

EQ 2-6

Note: For other combinations of temperature and voltage settings, refer to the *eX, SX-A and RT54SX-S Power Calculator*.

AC Power Dissipation

The power dissipation of the SX-A family is usually dominated by the dynamic power dissipation. Dynamic power dissipation is a function of frequency, equivalent capacitance, and power supply voltage. The AC power dissipation is defined as follows:

$$P_{AC} = P_{C\text{-cells}} + P_{R\text{-cells}} + P_{CLKA} + P_{CLKB} + P_{HCLK} + P_{Output\ Buffer} + P_{Input\ Buffer}$$

EQ 2-7

or:

$$P_{AC} = V_{CCA}^2 * [(m * C_{EQCM} * fm)_{C\text{-cells}} + (m * C_{EQSM} * fm)_{R\text{-cells}} + (n * C_{EQI} * f_n)_{Input\ Buffer} + (p * (C_{EQO} + C_L) * f_p)_{Output\ Buffer} + (0.5 * (q_1 * C_{EQCR} * f_{q1}) + (r_1 * f_{q1}))_{CLKA} + (0.5 * (q_2 * C_{EQCR} * f_{q2}) + (r_2 * f_{q2}))_{CLKB} + (0.5 * (s_1 * C_{EQHV} * f_{s1}) + (C_{EQHF} * f_{s1}))_{HCLK}]$$

EQ 2-8

Thermal Characteristics

Introduction

The temperature variable in Actel Designer software refers to the junction temperature, not the ambient, case, or board temperatures. This is an important distinction because dynamic and static power consumption will cause the chip's junction to be higher than the ambient, case, or board temperatures. EQ 2-9 and EQ 2-10 give the relationship between thermal resistance, temperature gradient and power.

$$\theta_{JA} = \frac{T_J - T_A}{P}$$

EQ 2-9

$$\theta_{JA} = \frac{T_C - T_A}{P}$$

EQ 2-10

Where:

θ_{JA} = Junction-to-air thermal resistance

θ_{JC} = Junction-to-case thermal resistance

T_J = Junction temperature

T_A = Ambient temperature

T_C = Ambient temperature

P = total power dissipated by the device

Table 2-12 • **Package Thermal Characteristics**

Package Type	Pin Count	θ_{JC}	θ_{JA}			Units
			Still Air	1.0 m/s 200 ft./min.	2.5 m/s 500 ft./min.	
Thin Quad Flat Pack (TQFP)	100	14	33.5	27.4	25	°C/W

Notes:

1. *All –3 speed grades have been discontinued.*
2. *Delays based on 10 pF loading and 25 Ω resistance.*
3. *To obtain the slew rate, substitute the appropriate Delta value, load capacitance, and the V_{CCI} value into the following equation:*
   Slew Rate [V/ns] = $(0.1*V_{CCI} – 0.9*V_{CCI})/ (C_{load} * d_{T[LH|HL|HLS]})$
   where C_{load} is the load capacitance driven by the I/O in pF
   $d_{T[LH|HL|HLS]}$ is the worst case delta value from the datasheet in ns/pF.
4. *Delays based on 35 pF loading.*

Table 2-41 • **A54SX72A Timing Characteristics**
(Worst-Case Commercial Conditions V_{CCA} = 2.25 V, V_{CCI} = 4.75 V, T_J = 70°C)

Datasheet Information

List of Changes

The following table lists critical changes that were made in the current version of the document.

Previous Version	Changes in Current Version (v5.3)	Page
v5.2 (June 2006)	–3 speed grades have been discontinued.	N/A
	The "SX-A Timing Model" was updated with –2 data.	2-14
v5.1 February 2005	RoHS information was added to the "Ordering Information".	ii
	The "Programming" section was updated.	1-13
v5.0	Revised Table 1 and the timing data to reflect the phase out of the –3 speed grade for the A54SX08A device.	i
	The "Thermal Characteristics" section was updated.	2-11
	The "176-Pin TQFP" was updated to add pins 81 to 90.	3-11
	The "484-Pin FBGA" was updated to add pins R4 to Y26	3-26
v4.0	The "Temperature Grade Offering" is new.	1-iii
	The "Speed Grade and Temperature Grade Matrix" is new.	1-iii
	"SX-A Family Architecture" was updated.	1-1
	"Clock Resources" was updated.	1-5
	"User Security" was updated.	1-7
	"Power-Up/Down and Hot Swapping" was updated.	1-7
	"Dedicated Mode" is new	1-9
	Table 1-5 is new.	1-9
	"JTAG Instructions" is new	1-10
	"Design Considerations" was updated.	1-12
	The "Programming" section is new.	1-13
	"Design Environment" was updated.	1-13
	"Pin Description" was updated.	1-15
	Table 2-1 was updated.	2-1
	Table 2-2 was updated.	2-1
	Table 2-3 is new.	2-1
	Table 2-4 is new.	2-1
	Table 2-5 was updated.	2-2
	Table 2-6 was updated.	2-2
	"Power Dissipation" is new.	2-8
	Table 2-11 was updated.	2-9
