Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Active
Number of LABs/CLBs	6036
Number of Logic Elements/Cells	-
Total RAM Bits	-
Number of I/O	203
Number of Gates	108000
Voltage - Supply	2.25V ~ 5.25V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 70°C (TA)
Package / Case	256-LBGA
Supplier Device Package	256-FPBGA (17x17)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/a54sx72a-1fgg256

Clock Resources

Actel's high-drive routing structure provides three clock networks (Table 1-1). The first clock, called HCLK, is hardwired from the HCLK buffer to the clock select multiplexor (MUX) in each R-cell. HCLK cannot be connected to combinatorial logic. This provides a fast propagation path for the clock signal. If not used, this pin must be set as Low or High on the board. It must not be left floating. Figure 1-7 describes the clock circuit used for the constant load HCLK and the macros supported.

HCLK does not function until the fourth clock cycle each time the device is powered up to prevent false output levels due to any possible slow power-on-reset signal and fast start-up clock circuit. To activate HCLK from the first cycle, the TRST pin must be reserved in the Design software and the pin must be tied to GND on the board.

Two additional clocks (CLKA, CLKB) are global clocks that can be sourced from external pins or from internal logic signals within the SX-A device. CLKA and CLKB may be connected to sequential cells or to combinational logic. If CLKA or CLKB pins are not used or sourced from signals, these pins must be set as Low or High on the board. They must not be left floating. Figure 1-8 describes the CLKA and CLKB circuit used and the macros supported in SX-A devices with the exception of A54SX72A.

In addition, the A54SX72A device provides four quadrant clocks (QCLKA, QCLKB, QCLKC, and QCLKD—corresponding to bottom-left, bottom-right, top-left, and top-right locations on the die, respectively), which can be sourced from external pins or from internal logic signals within the device. Each of these clocks can individually drive up to an entire quadrant of the chip, or they can be grouped together to drive multiple quadrants (Figure 1-9 on page 1-6). QCLK pins can function as user I/O pins. If not used, the QCLK pins must be tied Low or High on the board and must not be left floating.

For more information on how to use quadrant clocks in the A54SX72A device, refer to the *Global Clock Networks in Actel's Antifuse Device*s and *Using A54SX72A and RT54SX72S Quadrant Clocks* application notes.

The CLKA, CLKB, and QCLK circuits for A54SX72A as well as the macros supported are shown in Figure 1-10 on page 1-6. Note that bidirectional clock buffers are only available in A54SX72A. For more information, refer to the "Pin Description" section on page 1-15.

Table 1-1 • **SX-A Clock Resources**

	A54SX08A	A54SX16A	A54SX32A	A54SX72A
Routed Clocks (CLKA, CLKB)	2	2	2	2
Hardwired Clocks (HCLK)	1	1	1	1
Quadrant Clocks (QCLKA, QCLKB, QCLKC, QCLKD)	0	0	0	4

JTAG Instructions

Table 1-7 lists the supported instructions with the corresponding IR codes for SX-A devices.

Table 1-8 lists the codes returned after executing the IDCODE instruction for SX-A devices. Note that bit 0 is always '1'. Bits 11-1 are always '02F', which is the Actel manufacturer code.

Table 1-7 • **JTAG Instruction Code**

Instructions (IR4:IR0)	**Binary Code**
EXTEST	00000

		1	B	40B2, 42B2
	0.25 µ	1	B	22B2

Probing Capabilities

SX-A devices also provide an internal probing capability that is accessed with the JTAG pins. The Silicon Explorer II diagnostic hardware is used to control the TDI, TCK, TMS, and TDO pins to select the desired nets for debugging. The user assigns the selected internal nets in Actel Silicon Explorer II software to the PRA/PRB output pins for observation. Silicon Explorer II automatically places the device into JTAG mode. However, probing functionality is only activated when the TRST pin is driven high or left floating, allowing the internal pull-up resistor to pull TRST High. If the TRST pin is held Low, the TAP controller remains in the Test-Logic-Reset state so no probing can be performed. However, the user must drive the TRST pin High or allow the internal pull-up resistor to pull TRST High.

When selecting the **Reserve Probe Pin** box as shown in Figure 1-12 on page 1-9, direct the layout tool to reserve the PRA and PRB pins as dedicated outputs for probing. This **Reserve** option is merely a guideline. If the designer assigns user I/Os to the PRA and PRB pins and selects the **Reserve Probe Pin** option, Designer Layout will override the **Reserve Probe Pin** option and place the user I/Os on those pins.

To allow probing capabilities, the security fuse must not be programmed. Programming the security fuse disables the JTAG and probe circuitry. Table 1-9 summarizes the possible device configurations for probing once the device leaves the Test-Logic-Reset JTAG state.

Table 1-9 • **Device Configuration Options for Probe Capability (TRST Pin Reserved)**

JTAG Mode	TRST[1]	Security Fuse Programmed	PRA, PRB[2]	TDI, TCK, TDO[2]
Dedicated	Low	No	User I/O[3]	JTAG Disabled
	High	No	Probe Circuit Outputs	JTAG I/O
Flexible	Low	No	User I/O[3]	User I/O[3]
	High	No	Probe Circuit Outputs	JTAG I/O
		Yes	Probe Circuit Secured	Probe Circuit Secured

Notes:

1. *If the TRST pin is not reserved, the device behaves according to TRST = High as described in the table.*
2. *Avoid using the TDI, TCK, TDO, PRA, and PRB pins as input or bidirectional ports. Since these pins are active during probing, input signals will not pass through these pins and may cause contention.*
3. *If no user signal is assigned to these pins, they will behave as unused I/Os in this mode. Unused pins are automatically tristated by the Designer software.*

SX-A Probe Circuit Control Pins

SX-A devices contain internal probing circuitry that provides built-in access to every node in a design, enabling 100% real-time observation and analysis of a device's internal logic nodes without design iteration. The probe circuitry is accessed by Silicon Explorer II, an easy to use, integrated verification and logic analysis tool that can sample data at 100 MHz (asynchronous) or 66 MHz (synchronous). Silicon Explorer II attaches to a PC's standard COM port, turning the PC into a fully functional 18-channel logic analyzer. Silicon Explorer II allows designers to complete the design verification process at their desks and reduces verification time from several hours per cycle to a few seconds.

The Silicon Explorer II tool uses the boundary-scan ports (TDI, TCK, TMS, and TDO) to select the desired nets for verification. The selected internal nets are assigned to the PRA/PRB pins for observation. Figure 1-13 illustrates the interconnection between Silicon Explorer II and the FPGA to perform in-circuit verification.

Design Considerations

In order to preserve device probing capabilities, users should avoid using the TDI, TCK, TDO, PRA, and PRB pins as input or bidirectional ports. Since these pins are active during probing, critical input signals through these pins are not available. In addition, the security fuse must not be programmed to preserve probing capabilities. Actel recommends that you use a 70 Ω series termination resistor on every probe connector (TDI, TCK, TMS, TDO, PRA, PRB). The 70 Ω series termination is used to prevent data transmission corruption during probing and reading back the checksum.

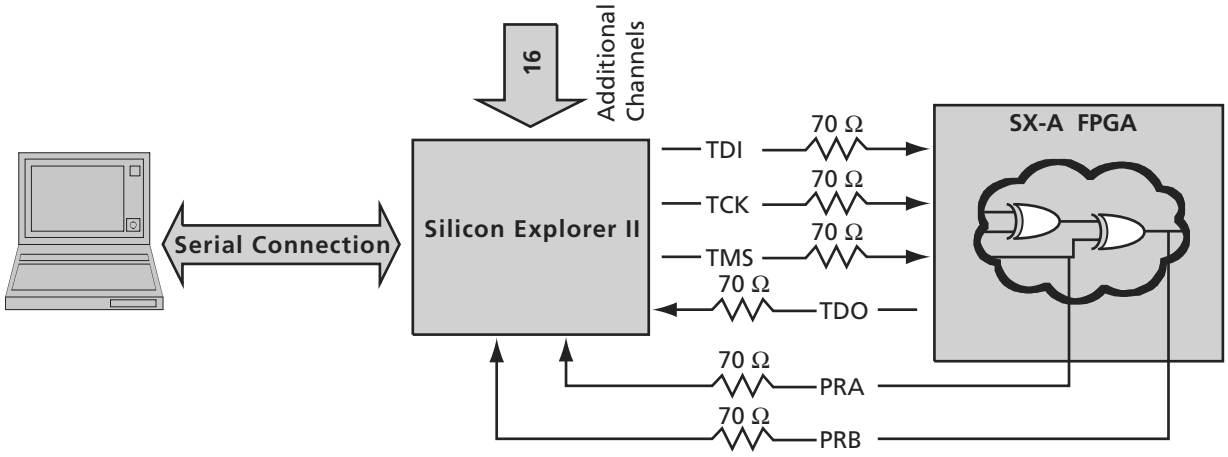

Figure 1-13 • **Probe Setup**

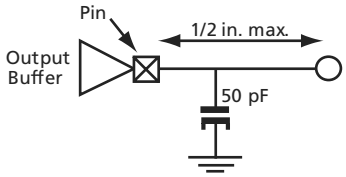
Table 2-8 • **AC Specifications (5 V PCI Operation)**

Symbol	Parameter	Condition	Min.	Max.	Units
$I_{OH(AC)}$	Switching Current High	$0 < V_{OUT} \le 1.4$ [1]	–44	–	mA
		$1.4 \le V_{OUT} < 2.4$ [1, 2]	$(–44 + (V_{OUT} – 1.4)/0.024)$	–	mA
		$3.1 < V_{OUT} < V_{CCI}$ [1, 3]	–	EQ 2-1 on page 2-5	–
	(Test Point)	$V_{OUT} = 3.1$ [3]	–	–142	mA
$I_{OL(AC)}$	Switching Current Low	$V_{OUT} \ge 2.2$ [1]	95	–	mA
		$2.2 > V_{OUT} > 0.55$ [1]	$(V_{OUT}/0.023)$	–	mA
		$0.71 > V_{OUT} > 0$ [1, 3]	–	EQ 2-2 on page 2-5	–
	(Test Point)	$V_{OUT} = 0.71$ [3]	–	206	mA
I_{CL}	Low Clamp Current	$–5 < V_{IN} \le –1$	$–25 + (V_{IN} + 1)/0.015$	–	mA
$slew_R$	Output Rise Slew Rate	0.4 V to 2.4 V load [4]	1	5	V/ns
$slew_F$	Output Fall Slew Rate	2.4 V to 0.4 V load [4]	1	5	V/ns

Notes:

1. *Refer to the V/I curves in Figure 2-1 on page 2-5. Switching current characteristics for REQ# and GNT# are permitted to be one half of that specified here; i.e., half size output drivers may be used on these signals. This specification does not apply to CLK and RST#, which are system outputs. "Switching Current High" specifications are not relevant to SERR#, INTA#, INTB#, INTC#, and INTD#, which are open drain outputs.*
2. *Note that this segment of the minimum current curve is drawn from the AC drive point directly to the DC drive point rather than toward the voltage rail (as is done in the pull-down curve). This difference is intended to allow for an optional N-channel pull-up.*
3. *Maximum current requirements must be met as drivers pull beyond the last step voltage. Equations defining these maximums (A and B) are provided with the respective diagrams in Figure 2-1 on page 2-5. The equation defined maximum should be met by design. In order to facilitate component testing, a maximum current test point is defined for each side of the output driver.*
4. *This parameter is to be interpreted as the cumulative edge rate across the specified range, rather than the instantaneous rate at any point within the transition range. The specified load (diagram below) is optional; i.e., the designer may elect to meet this parameter with an unloaded output per revision 2.0 of the PCI Local Bus Specification. However, adherence to both maximum and minimum parameters is now required (the maximum is no longer simply a guideline). Since adherence to the maximum slew rate was not required prior to revision 2.1 of the specification, there may be components in the market for some time that have faster edge rates; therefore, motherboard designers must bear in mind that rise and fall times faster than this specification could occur and should ensure that signal integrity modeling accounts for this. Rise slew rate does not apply to open drain outputs.*



Where:

C_{EQCM} = Equivalent capacitance of combinatorial modules (C-cells) in pF

C_{EQSM} = Equivalent capacitance of sequential modules (R-Cells) in pF

C_{EQI} = Equivalent capacitance of input buffers in pF

C_{EQO} = Equivalent capacitance of output buffers in pF

C_{EQCR} = Equivalent capacitance of CLKA/B in pF

C_{EQHV} = Variable capacitance of HCLK in pF

C_{EQHF} = Fixed capacitance of HCLK in pF

C_{L} = Output lead capacitance in pF

f_m = Average logic module switching rate in MHz

f_n = Average input buffer switching rate in MHz

f_p = Average output buffer switching rate in MHz

f_{q1} = Average CLKA rate in MHz

f_{q2} = Average CLKB rate in MHz

f_{s1} = Average HCLK rate in MHz

m = Number of logic modules switching at fm

n = Number of input buffers switching at fn

p = Number of output buffers switching at fp

q_1 = Number of clock loads on CLKA

q_2 = Number of clock loads on CLKB

r_1 = Fixed capacitance due to CLKA

r_2 = Fixed capacitance due to CLKB

s_1 = Number of clock loads on HCLK

x = Number of I/Os at logic low

y = Number of I/Os at logic high

Table 2-11 • **CEQ Values for SX-A Devices**

	A54SX08A	**A54SX16A**	**A54SX32A**	**A54SX72A**

Notes:

1. *All –3 speed grades have been discontinued.*
2. *Delays based on 50 pF loading.*
3. *To obtain the slew rate, substitute the appropriate Delta value, load capacitance, and the V_{CCI} value into the following equation:*
   Slew Rate [V/ns] = $(0.1*V_{CCI} – 0.9*V_{CCI})/ (C_{load} * d_{T[LH|HL|HLS]})$
   where C_{load} is the load capacitance driven by the I/O in pF
   $d_{T[LH|HL|HLS]}$ is the worst case delta value from the datasheet in ns/pF.
4. *Delays based on 35 pF loading.*

Datasheet Categories

In order to provide the latest information to designers, some datasheets are published before data has been fully characterized. Datasheets are designated as "Product Brief," "Advanced," "Production," and "Datasheet Supplement." The definitions of these categories are as follows:

Product Brief

The product brief is a summarized version of a datasheet (advanced or production) containing general product information. This brief gives an overview of specific device and family information.

Advanced

This datasheet version contains initial estimated information based on simulation, other products, devices, or speed grades. This information can be used as estimates, but not for production.

Unmarked (production)

This datasheet version contains information that is considered to be final.

Datasheet Supplement

The datasheet supplement gives specific device information for a derivative family that differs from the general family datasheet. The supplement is to be used in conjunction with the datasheet to obtain more detailed information and for specifications that do not differ between the two families.

International Traffic in Arms Regulations (ITAR) and Export Administration Regulations (EAR)

The products described in this datasheet are subject to the International Traffic in Arms Regulations (ITAR) or the Export Administration Regulations (EAR). They may require an approved export license prior to their export. An export can include a release or disclosure to a foreign national inside or outside the United States.
