Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Details	
Product Status	Active
Number of LABs/CLBs	6036
Number of Logic Elements/Cells	-
Total RAM Bits	-
Number of I/O	360
Number of Gates	108000
Voltage - Supply	2.25V ~ 5.25V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 85°C (TA)
Package / Case	484-BGA
Supplier Device Package	484-FPBGA (27X27)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/a54sx72a-fg484i

Power-Up/Down and Hot Swapping

SX-A I/Os are configured to be hot-swappable, with the exception of 3.3 V PCI. During power-up/down (or partial up/down), all I/Os are tristated. V_{CCA} and V_{CCI} do not have to be stable during power-up/down, and can be powered up/down in any order. When the SX-A device is plugged into an electrically active system, the device will not degrade the reliability of or cause damage to the host system. The device's output pins are driven to a high impedance state until normal chip operating conditions are reached. Table 1-4 summarizes the V_{CCA} voltage at which the I/Os behave according to the user's design for an SX-A device at room temperature for various ramp-up rates. The data reported assumes a linear ramp-up profile to 2.5 V. For more information on power-up and hot-swapping, refer to the application note, *Actel SX-A and RT54SX-S Devices in Hot-Swap and Cold-Sparing Applications*.

Table 1-2 • **I/O Features**

Function	Description
Input Buffer Threshold Selections	• 5 V: PCI, TTL • 3.3 V: PCI, LVTTL • 2.5 V: LVCMOS2 (commercial only)
Flexible Output Driver	• 5 V: PCI, TTL • 3.3 V: PCI, LVTTL • 2.5 V: LVCMOS2 (commercial only)
Output Buffer	"Hot-Swap" Capability (3.3 V PCI is not hot swappable) • I/O on an unpowered device does not sink current • Can be used for "cold-sparing" Selectable on an individual I/O basis Individually selectable slew rate; high slew or low slew (The default is high slew rate). The slew is only affected on the falling edge of an output. Rising edges of outputs are not affected.
Power-Up	Individually selectable pull-ups and pull-downs during power-up (default is to power-up in tristate) Enables deterministic power-up of device V_{CCA} and V_{CCI} can be powered in any order

Table 1-3 • **I/O Characteristics for All I/O Configurations**

	Hot Swappable	Slew Rate Control	Power-Up Resistor
TTL, LVTTL, LVCMOS2	Yes	Yes. Only affects falling edges of outputs	Pull-up or pull-down
3.3 V PCI	No	No. High slew rate only	Pull-up or pull-down
5 V PCI	Yes	No. High slew rate only	Pull-up or pull-down

Table 1-4 • **Power-Up Time at which I/Os Become Active**

	0.25 µ	1	B	22B2

Probing Capabilities

SX-A devices also provide an internal probing capability that is accessed with the JTAG pins. The Silicon Explorer II diagnostic hardware is used to control the TDI, TCK, TMS, and TDO pins to select the desired nets for debugging. The user assigns the selected internal nets in Actel Silicon Explorer II software to the PRA/PRB output pins for observation. Silicon Explorer II automatically places the device into JTAG mode. However, probing functionality is only activated when the TRST pin is driven high or left floating, allowing the internal pull-up resistor to pull TRST High. If the TRST pin is held Low, the TAP controller remains in the Test-Logic-Reset state so no probing can be performed. However, the user must drive the TRST pin High or allow the internal pull-up resistor to pull TRST High.

When selecting the **Reserve Probe Pin** box as shown in Figure 1-12 on page 1-9, direct the layout tool to reserve the PRA and PRB pins as dedicated outputs for probing. This **Reserve** option is merely a guideline. If the designer assigns user I/Os to the PRA and PRB pins and selects the **Reserve Probe Pin** option, Designer Layout will override the **Reserve Probe Pin** option and place the user I/Os on those pins.

To allow probing capabilities, the security fuse must not be programmed. Programming the security fuse disables the JTAG and probe circuitry. Table 1-9 summarizes the possible device configurations for probing once the device leaves the Test-Logic-Reset JTAG state.

Table 1-9 • **Device Configuration Options for Probe Capability (TRST Pin Reserved)**

JTAG Mode	TRST[1]	Security Fuse Programmed	PRA, PRB[2]	TDI, TCK, TDO[2]
Dedicated	Low	No	User I/O[3]	JTAG Disabled
	High	No	Probe Circuit Outputs	JTAG I/O
Flexible	Low	No	User I/O[3]	User I/O[3]
	High	No	Probe Circuit Outputs	JTAG I/O
		Yes	Probe Circuit Secured	Probe Circuit Secured

Notes:

1. *If the TRST pin is not reserved, the device behaves according to TRST = High as described in the table.*
2. *Avoid using the TDI, TCK, TDO, PRA, and PRB pins as input or bidirectional ports. Since these pins are active during probing, input signals will not pass through these pins and may cause contention.*
3. *If no user signal is assigned to these pins, they will behave as unused I/Os in this mode. Unused pins are automatically tristated by the Designer software.*

Pin Description

CLKA/B, I/O **Clock A and B**

These pins are clock inputs for clock distribution networks. Input levels are compatible with standard TTL, LVTTL, LVCMOS2, 3.3 V PCI, or 5 V PCI specifications. The clock input is buffered prior to clocking the R-cells. When not used, this pin must be tied Low or High (NOT left floating) on the board to avoid unwanted power consumption.

For A54SX72A, these pins can also be configured as user I/Os. When employed as user I/Os, these pins offer built-in programmable pull-up or pull-down resistors active during power-up only. When not used, these pins must be tied Low or High (NOT left floating).

QCLKA/B/C/D, I/O **Quadrant Clock A, B, C, and D**

These four pins are the quadrant clock inputs and are only used for A54SX72A with A, B, C, and D corresponding to bottom-left, bottom-right, top-left, and top-right quadrants, respectively. They are clock inputs for clock distribution networks. Input levels are compatible with standard TTL, LVTTL, LVCMOS2, 3.3 V PCI, or 5 V PCI specifications. Each of these clock inputs can drive up to a quarter of the chip, or they can be grouped together to drive multiple quadrants. The clock input is buffered prior to clocking the R-cells. When not used, these pins must be tied Low or High on the board (NOT left floating).

These pins can also be configured as user I/Os. When employed as user I/Os, these pins offer built-in programmable pull-up or pull-down resistors active during power-up only.

GND **Ground**

Low supply voltage.

HCLK **Dedicated (Hardwired) Array Clock**

This pin is the clock input for sequential modules. Input levels are compatible with standard TTL, LVTTL, LVCMOS2, 3.3 V PCI, or 5 V PCI specifications. This input is directly wired to each R-cell and offers clock speeds independent of the number of R-cells being driven. When not used, HCLK must be tied Low or High on the board (NOT left floating). When used, this pin should be held Low or High during power-up to avoid unwanted static power consumption.

I/O **Input/Output**

The I/O pin functions as an input, output, tristate, or bidirectional buffer. Based on certain configurations, input and output levels are compatible with standard TTL, LVTTL, LVCMOS2, 3.3 V PCI or 5 V PCI specifications. Unused I/O pins are automatically tristated by the Designer software.

NC **No Connection**

This pin is not connected to circuitry within the device and can be driven to any voltage or be left floating with no effect on the operation of the device.

PRA/B, I/O **Probe A/B**

The Probe pin is used to output data from any user-defined design node within the device. This independent diagnostic pin can be used in conjunction with the other probe pin to allow real-time diagnostic output of any signal path within the device. The Probe pin can be used as a user-defined I/O when verification has been completed. The pin’s probe capabilities can be permanently disabled to protect programmed design confidentiality.

TCK, I/O **Test Clock**

Test clock input for diagnostic probe and device programming. In Flexible mode, TCK becomes active when the TMS pin is set Low (refer to Table 1-6 on page 1-9). This pin functions as an I/O when the boundary scan state machine reaches the "logic reset" state.

TDI, I/O **Test Data Input**

Serial input for boundary scan testing and diagnostic probe. In Flexible mode, TDI is active when the TMS pin is set Low (refer to Table 1-6 on page 1-9). This pin functions as an I/O when the boundary scan state machine reaches the “logic reset” state.

TDO, I/O **Test Data Output**

Serial output for boundary scan testing. In flexible mode, TDO is active when the TMS pin is set Low (refer to Table 1-6 on page 1-9). This pin functions as an I/O when the boundary scan state machine reaches the "logic reset" state. When Silicon Explorer II is being used, TDO will act as an output when the checksum command is run. It will return to user /IO when checksum is complete.

TMS **Test Mode Select**

The TMS pin controls the use of the IEEE 1149.1 Boundary Scan pins (TCK, TDI, TDO, TRST). In flexible mode when the TMS pin is set Low, the TCK, TDI, and TDO pins are boundary scan pins (refer to Table 1-6 on page 1-9). Once the boundary scan pins are in test mode, they will remain in that mode until the internal boundary scan state machine reaches the logic reset state. At this point, the boundary scan pins will be released and will function as regular I/O pins. The logic reset state is reached five TCK cycles after the TMS pin is set High. In dedicated test mode, TMS functions as specified in the IEEE 1149.1 specifications.

TRST, I/O **Boundary Scan Reset Pin**

Once it is configured as the JTAG Reset pin, the TRST pin functions as an active low input to asynchronously initialize or reset the boundary scan circuit. The TRST pin is equipped with an internal pull-up resistor. This pin functions as an I/O when the **Reserve JTAG Reset Pin** is not selected in Designer.

V_{CCI} **Supply Voltage**

Supply voltage for I/Os. See Table 2-2 on page 2-1. All V_{CCI} power pins in the device should be connected.

V_{CCA} **Supply Voltage**

Supply voltage for array. See Table 2-2 on page 2-1. All V_{CCA} power pins in the device should be connected.

Table 2-8 • **AC Specifications (5 V PCI Operation)**

Symbol	Parameter	Condition	Min.	Max.	Units
$I_{OH(AC)}$	Switching Current High	$0 < V_{OUT} \leq 1.4$ [1]	–44	–	mA
		$1.4 \leq V_{OUT} < 2.4$ [1, 2]	$(-44 + (V_{OUT} - 1.4)/0.024)$	–	mA
		$3.1 < V_{OUT} < V_{CCI}$ [1, 3]	–	EQ 2-1 on page 2-5	–
	(Test Point)	$V_{OUT} = 3.1$ [3]	–	–142	mA
$I_{OL(AC)}$	Switching Current Low	$V_{OUT} \geq 2.2$ [1]	95	–	mA
		$2.2 > V_{OUT} > 0.55$ [1]	$(V_{OUT}/0.023)$	–	mA
		$0.71 > V_{OUT} > 0$ [1, 3]	–	EQ 2-2 on page 2-5	–
	(Test Point)	$V_{OUT} = 0.71$ [3]	–	206	mA
I_{CL}	Low Clamp Current	$-5 < V_{IN} \leq -1$	$-25 + (V_{IN} + 1)/0.015$	–	mA
$slew_R$	Output Rise Slew Rate	0.4 V to 2.4 V load [4]	1	5	V/ns
$slew_F$	Output Fall Slew Rate	2.4 V to 0.4 V load [4]	1	5	V/ns

Notes:

1. *Refer to the V/I curves in Figure 2-1 on page 2-5. Switching current characteristics for REQ# and GNT# are permitted to be one half of that specified here; i.e., half size output drivers may be used on these signals. This specification does not apply to CLK and RST#, which are system outputs. "Switching Current High" specifications are not relevant to SERR#, INTA#, INTB#, INTC#, and INTD#, which are open drain outputs.*
2. *Note that this segment of the minimum current curve is drawn from the AC drive point directly to the DC drive point rather than toward the voltage rail (as is done in the pull-down curve). This difference is intended to allow for an optional N-channel pull-up.*
3. *Maximum current requirements must be met as drivers pull beyond the last step voltage. Equations defining these maximums (A and B) are provided with the respective diagrams in Figure 2-1 on page 2-5. The equation defined maximum should be met by design. In order to facilitate component testing, a maximum current test point is defined for each side of the output driver.*
4. *This parameter is to be interpreted as the cumulative edge rate across the specified range, rather than the instantaneous rate at any point within the transition range. The specified load (diagram below) is optional; i.e., the designer may elect to meet this parameter with an unloaded output per revision 2.0 of the PCI Local Bus Specification. However, adherence to both maximum and minimum parameters is now required (the maximum is no longer simply a guideline). Since adherence to the maximum slew rate was not required prior to revision 2.1 of the specification, there may be components in the market for some time that have faster edge rates; therefore, motherboard designers must bear in mind that rise and fall times faster than this specification could occur and should ensure that signal integrity modeling accounts for this. Rise slew rate does not apply to open drain outputs.*

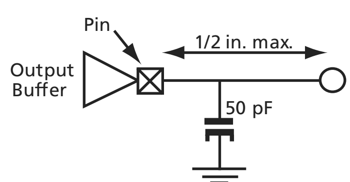

Table 2-10 • **AC Specifications (3.3 V PCI Operation)**

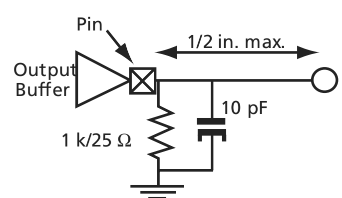
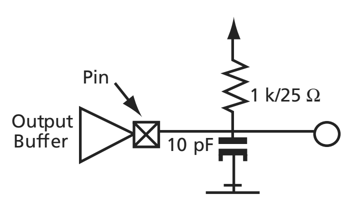
Symbol	Parameter	Condition	Min.	Max.	Units
$I_{OH(AC)}$	Switching Current High	$0 < V_{OUT} \leq 0.3V_{CCI}$ [1]	$-12V_{CCI}$	–	mA
		$0.3V_{CCI} \leq V_{OUT} < 0.9V_{CCI}$ [1]	$(-17.1(V_{CCI} - V_{OUT}))$	–	mA
		$0.7V_{CCI} < V_{OUT} < V_{CCI}$ [1, 2]	–	EQ 2-3 on page 2-7	–
	(Test Point)	$V_{OUT} = 0.7V_{CC}$ [2]	–	$-32V_{CCI}$	mA
$I_{OL(AC)}$	Switching Current Low	$V_{CCI} > V_{OUT} \geq 0.6V_{CCI}$ [1]	$16V_{CCI}$	–	mA
		$0.6V_{CCI} > V_{OUT} > 0.1V_{CCI}$ [1]	$(26.7V_{OUT})$	–	mA
		$0.18V_{CCI} > V_{OUT} > 0$ [1, 2]	–	EQ 2-4 on page 2-7	–
	(Test Point)	$V_{OUT} = 0.18V_{CC}$ [2]	–	$38V_{CCI}$	mA
I_{CL}	Low Clamp Current	$-3 < V_{IN} \leq -1$	$-25 + (V_{IN} + 1)/0.015$	–	mA
I_{CH}	High Clamp Current	$V_{CCI} + 4 > V_{IN} \geq V_{CCI} + 1$	$25 + (V_{IN} - V_{CCI} - 1)/0.015$	–	mA
$slew_R$	Output Rise Slew Rate	$0.2V_{CCI}$ - $0.6V_{CCI}$ load [3]	1	4	V/ns
$slew_F$	Output Fall Slew Rate	$0.6V_{CCI}$ - $0.2V_{CCI}$ load [3]	1	4	V/ns

Notes:

1. *Refer to the V/I curves in Figure 2-2 on page 2-7. Switching current characteristics for REQ# and GNT# are permitted to be one half of that specified here; i.e., half size output drivers may be used on these signals. This specification does not apply to CLK and RST#, which are system outputs. "Switching Current High" specifications are not relevant to SERR#, INTA#, INTB#, INTC#, and INTD#, which are open drain outputs.*
2. *Maximum current requirements must be met as drivers pull beyond the last step voltage. Equations defining these maximums (C and D) are provided with the respective diagrams in Figure 2-2 on page 2-7. The equation defined maximum should be met by design. In order to facilitate component testing, a maximum current test point is defined for each side of the output driver.*
3. *This parameter is to be interpreted as the cumulative edge rate across the specified range, rather than the instantaneous rate at any point within the transition range. The specified load (diagram below) is optional; i.e., the designer may elect to meet this parameter with an unloaded output per the latest revision of the PCI Local Bus Specification. However, adherence to both maximum and minimum parameters is required (the maximum is no longer simply a guideline). Rise slew rate does not apply to open drain outputs.*





Power Dissipation

A critical element of system reliability is the ability of electronic devices to safely dissipate the heat generated during operation. The thermal characteristics of a circuit depend on the device and package used, the operating temperature, the operating current, and the system's ability to dissipate heat.

A complete power evaluation should be performed early in the design process to help identify potential heat-related problems in the system and to prevent the system from exceeding the device's maximum allowed junction temperature.

The actual power dissipated by most applications is significantly lower than the power the package can dissipate. However, a thermal analysis should be performed for all projects. To perform a power evaluation, follow these steps:

1. Estimate the power consumption of the application.
2. Calculate the maximum power allowed for the device and package.
3. Compare the estimated power and maximum power values.

Estimating Power Dissipation

The total power dissipation for the SX-A family is the sum of the DC power dissipation and the AC power dissipation:

$$P_{Total} = P_{DC} + P_{AC}$$

EQ 2-5

DC Power Dissipation

The power due to standby current is typically a small component of the overall power. An estimation of DC power dissipation under typical conditions is given by:

$$P_{DC} = I_{Standby} * V_{CCA}$$

EQ 2-6

Note: For other combinations of temperature and voltage settings, refer to the *eX, SX-A and RT54SX-S Power Calculator*.

AC Power Dissipation

The power dissipation of the SX-A family is usually dominated by the dynamic power dissipation. Dynamic power dissipation is a function of frequency, equivalent capacitance, and power supply voltage. The AC power dissipation is defined as follows:

$$P_{AC} = P_{C\text{-cells}} + P_{R\text{-cells}} + P_{CLKA} + P_{CLKB} + P_{HCLK} + P_{Output\ Buffer} + P_{Input\ Buffer}$$

EQ 2-7

or:

$$\begin{aligned} P_{AC} = {} & V_{CCA}^2 * [(m * C_{EQCM} * fm)_{C\text{-cells}} + (m * C_{EQSM} * fm)_{R\text{-cells}} + (n * C_{EQI} * f_n)_{Input\ Buffer} + (p * (C_{EQO} + C_L) * f_p)_{Output\ Buffer} \\ & + (0.5 * (q_1 * C_{EQCR} * f_{q1}) + (r_1 * f_{q1}))_{CLKA} + (0.5 * (q_2 * C_{EQCR} * f_{q2}) + (r_2 * f_{q2}))_{CLKB} + (0.5 * (s_1 * C_{EQHV} * f_{s1}) + \\ & (C_{EQHF} * f_{s1}))_{HCLK}] \end{aligned}$$

EQ 2-8

Timing Characteristics

Table 2-14 • **A54SX08A Timing Characteristics (Worst-Case Commercial Conditions, V_{CCA} = 2.25 V, V_{CCI} = 3.0 V, T_J = 70°C)**

Parameter	Description	–2 Speed Min.	–2 Speed Max.	–1 Speed Min.	–1 Speed Max.	Std. Speed Min.	Std. Speed Max.	–F Speed Min.	–F Speed Max.	Units

t_{INYL}	Input Data Pad to Y Low 5 V TTL		0.8		0.9		1.1		1.5	ns
Input Module Predicted Routing Delays[2]										
t_{IRD1}	FO = 1 Routing Delay		0.3		0.3		0.4		0.6	ns
t_{IRD2}	FO = 2 Routing Delay		0.5		0.5		0.6		0.8	ns
t_{IRD3}	FO = 3 Routing Delay		0.6		0.7		0.8		1.1	ns
t_{IRD4}	FO = 4 Routing Delay		0.8		0.9		1		1.4	ns
t_{IRD8}	FO = 8 Routing Delay		1.4		1.5		1.8		2.5	ns
t_{IRD12}	FO = 12 Routing Delay		2		2.2		2.6		3.6	ns

Notes:

1. *For dual-module macros, use $t_{PD} + t_{RD1} + t_{PDn}$, $t_{RCO} + t_{RD1} + t_{PDn}$, or $t_{PD1} + t_{RD1} + t_{SUD}$, whichever is appropriate.*
2. *Routing delays are for typical designs across worst-case operating conditions. These parameters should be used for estimating device performance. Post-route timing analysis or simulation is required to determine actual performance.*

Table 2-15 • **A54SX08A Timing Characteristics (Worst-Case Commercial Conditions V_{CCA} = 2.25 V, V_{CCI} = 2.25 V, T_J = 70°C)**

Previous Version	Changes in Current Version (v5.3)	Page
v4.0	Table 2-12 was updated.	2-11
(continued)	The was updated.	2-14
	The "Sample Path Calculations" were updated.	2-14
	Table 2-13 was updated.	2-17
	Table 2-13 was updated.	2-17
	All timing tables were updated.	2-18 to 2-52
v3.0	The "Actel Secure Programming Technology with FuseLock™ Prevents Reverse Engineering and Design Theft" section was updated.	1-i
	The "Ordering Information" section was updated.	1-ii
	The "Temperature Grade Offering" section was updated.	1-iii
	The Figure 1-1 • SX-A Family Interconnect Elements was updated.	1-1
	The “"Clock Resources" section“was updated	1-5
	The Table 1-1 • SX-A Clock Resources is new.	1-5
	The "User Security" section is new.	1-7
	The "I/O Modules" section was updated.	1-7
	The Table 1-2 • I/O Features was updated.	1-8
	The Table 1-3 • I/O Characteristics for All I/O Configurations is new.	1-8
	The Table 1-4 • Power-Up Time at which I/Os Become Active is new	1-8
	The Figure 1-12 • Device Selection Wizard is new.	1-9
	The "Boundary-Scan Pin Configurations and Functions" section is new.	1-9
	The Table 1-9 • Device Configuration Options for Probe Capability (TRST Pin Reserved) is new.	1-11
	The "SX-A Probe Circuit Control Pins" section was updated.	1-12
	The "Design Considerations" section was updated.	1-12
	The Figure 1-13 • Probe Setup was updated.	1-12
	The Design Environment was updated.	1-13
	The Figure 1-13 • Design Flow is new.	1-11
	The "Absolute Maximum Ratings*" section was updated.	1-12
	The "Recommended Operating Conditions" section was updated.	1-12
	The "Electrical Specifications" section was updated.	1-12
	The "2.5V LVCMOS2 Electrical Specifications" section was updated.	1-13
	The "SX-A Timing Model" and "Sample Path Calculations" equations were updated.	1-23
	The "Pin Description" section was updated.	1-15
v2.0.1	The "Design Environment" section has been updated.	1-13
	The "I/O Modules" section, and Table 1-2 • I/O Features have been updated.	1-8
	The "SX-A Timing Model" section and the "Timing Characteristics" section have new timing numbers.	1-23

Datasheet Categories

In order to provide the latest information to designers, some datasheets are published before data has been fully characterized. Datasheets are designated as "Product Brief," "Advanced," "Production," and "Datasheet Supplement." The definitions of these categories are as follows:

Product Brief

The product brief is a summarized version of a datasheet (advanced or production) containing general product information. This brief gives an overview of specific device and family information.

Advanced

This datasheet version contains initial estimated information based on simulation, other products, devices, or speed grades. This information can be used as estimates, but not for production.

Unmarked (production)

This datasheet version contains information that is considered to be final.

Datasheet Supplement

The datasheet supplement gives specific device information for a derivative family that differs from the general family datasheet. The supplement is to be used in conjunction with the datasheet to obtain more detailed information and for specifications that do not differ between the two families.

International Traffic in Arms Regulations (ITAR) and Export Administration Regulations (EAR)

The products described in this datasheet are subject to the International Traffic in Arms Regulations (ITAR) or the Export Administration Regulations (EAR). They may require an approved export license prior to their export. An export can include a release or disclosure to a foreign national inside or outside the United States.
