
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	Coldfire V4E
Core Size	32-Bit Single-Core
Speed	166MHz
Connectivity	CANbus, EBI/EMI, Ethernet, I²C, SPI, UART/USART, USB
Peripherals	DMA, PWM, WDT
Number of I/O	99
Program Memory Size	-
Program Memory Type	ROMless
EEPROM Size	-
RAM Size	32K x 8
Voltage - Supply (Vcc/Vdd)	1.43V ~ 1.58V
Data Converters	-
Oscillator Type	External
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	388-BBGA
Supplier Device Package	388-PBGA (27x27)
Purchase URL	https://www.e-xfl.com/pro/item?MUrl=&PartUrl=mcf5480czp166

1 Maximum Ratings

Table 1 lists maximum and minimum ratings for supply and operating voltages and storage temperature. Operating outside of these ranges may cause erratic behavior or damage to the processor.

Table 1. Absolute Maximum Ratings

Rating	Symbol	Value	Units
External (I/O pads) supply voltage (3.3-V power pins)	EV_{DD}	–0.3 to +4.0	V
Internal logic supply voltage	IV_{DD}	–0.5 to +2.0	V
Memory (I/O pads) supply voltage (2.5-V power pins)	SD V_{DD}	–0.3 to +4.0 SDR Memory –0.3 to +2.8 DDR Memory	V
PLL supply voltage	PLL V_{DD}	–0.5 to +2.0	V
Internal logic supply voltage, input voltage level	V_{in}	–0.5 to +3.6	V
Storage temperature range	T_{stg}	–55 to +150	°C

2 Thermal Characteristics

2.1 Operating Temperatures

Table 2 lists junction and ambient operating temperatures.

Table 2. Operating Temperatures

Characteristic	Symbol	Value	Units
Maximum operating junction temperature	T_j	105	°C
Maximum operating ambient temperature	T_{Amax}	<85[1]	°C
Minimum operating ambient temperature	T_{Amin}	–40	°C

1 This published maximum operating ambient temperature should be used only as a system design guideline. All device operating parameters are guaranteed only when the junction temperature lies within the specified range.

2.2 Thermal Resistance

Table 3 lists thermal resistance values.

Table 3. Thermal Resistance

Characteristic		Symbol	Value	Unit
324 pin TEPBGA — Junction to ambient, natural convection	Four layer board (2s2p)	θ_{JMA}	20–22[1,2]	°C/W
388 pin TEPBGA — Junction to ambient, natural convection	Four layer board (2s2p)	θ_{JMA}	19[1,2]	°C/W
Junction to ambient (@200 ft/min)	Four layer board (2s2p)	θ_{JMA}	16[1,2]	°C/W
Junction to board	—	θ_{JB}	11[3]	°C/W
Junction to case	—	θ_{JC}	7[4]	°C/W
Junction to top of package	Natural convection	Ψ_{jt}	2[1,5]	°C/W

1 θ_{JA} and Ψ_{jt} parameters are simulated in accordance with EIA/JESD Standard 51-2 for natural convection. Freescale recommends the use of θ_{JA} and power dissipation specifications in the system design to prevent device junction temperatures from exceeding the rated specification. System designers should be aware that device junction temperatures can be significantly influenced by board layout and surrounding devices. Conformance to the device junction temperature specification can be verified by physical measurement in the customer's system using the Ψ_{jt} parameter, the device power dissipation, and the method described in EIA/JESD Standard 51-2.

2 Per JEDEC JESD51-6 with the board horizontal.

3 Thermal resistance between the die and the printed circuit board per JEDEC JESD51-8. Board temperature is measured on the top surface of the board near the package.

4 Thermal resistance between the die and the case top surface as measured by the cold plate method (MIL SPEC-883 Method 1012.1).

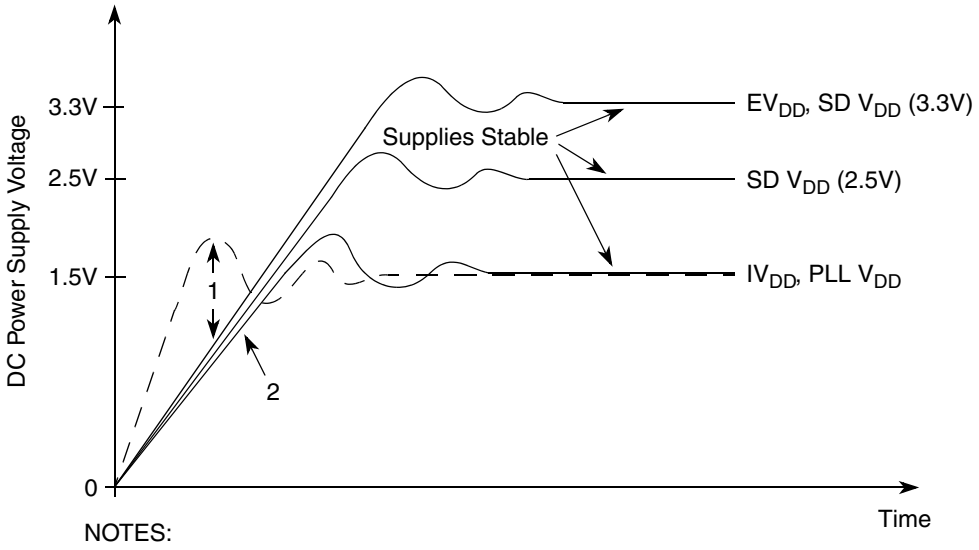
5 Thermal characterization parameter indicating the temperature difference between package top and the junction temperature per JEDEC JESD51-2. When Greek letters are not available, the thermal characterization parameter is written as Psi-JT.

3 DC Electrical Specifications

Table 4 lists DC electrical operating temperatures. This table is based on an operating voltage of EV_{DD} = 3.3 V_{DC} ± 0.3 V_{DC} and IV_{DD} of 1.5 ± 0.07 V_{DC}.

Table 4. DC Electrical Specifications

Characteristic	Symbol	Min	Max	Units
External (I/O pads) operation voltage range	EV_{DD}	3.0	3.6	V
Memory (I/O pads) operation voltage range (DDR Memory)	SD V_{DD}	2.30	2.70	V
Internal logic operation voltage range[1]	IV_{DD}	1.43	1.58	V
PLL Analog operation voltage range[1]	PLL V_{DD}	1.43	1.58	V
USB oscillator operation voltage range	USB_OSV_{DD}	3.0	3.6	V
USB digital logic operation voltage range	$USBV_{DD}$	3.0	3.6	V
USB PHY operation voltage range	USB_PHYV_{DD}	3.0	3.6	V
USB oscillator analog operation voltage range	USB_OSCAV_{DD}	1.43	1.58	V



NOTES:
1. IVDD should not exceed EVDD or SD VDD by more than 0.4V at any time, including power-up.
2. Recommended that IVDD/PLL VDD should track EVDD/SD VDD up to 0.9V, then separate for completion of ramps.
3. Input voltage must not be greater than the supply voltage (EVDD, SD VDD, IVDD, or PLL VDD) by more than 0.5V at any time, including during power-up.
4. Use 1 microsecond or slower rise time for all supplies.

Figure 3. Supply Voltage Sequencing and Separation Cautions

The relationship between SD V_{DD} and EV_{DD} is non-critical during power-up and power-down sequences. SD V_{DD} (2.5V or 3.3V) and EV_{DD} are specified relative to IV_{DD}.

4.2.1 Power Up Sequence

If EV_{DD}/SD V_{DD} are powered up with the IV_{DD} at 0V, the sense circuits in the I/O pads cause all pad output drivers connected to the EV_{DD}/SD V_{DD} to be in a high impedance state. There is no limit to how long after EV_{DD}/SD V_{DD} powers up before IV_{DD} must power up. IV_{DD} should not lead the EV_{DD}, SD V_{DD}, or PLL V_{DD} by more than 0.4V during power ramp up or there is high current in the internal ESD protection diodes. The rise times on the power supplies should be slower than 1 microsecond to avoid turning on the internal ESD protection clamp diodes.

The recommended power up sequence is as follows:

1. Use 1 microsecond or slower rise time for all supplies.
2. IV_{DD}/PLL V_{DD} and EV_{DD}/SD V_{DD} should track up to 0.9V, then separate for the completion of ramps with EV_{DD}/SD V_{DD} going to the higher external voltages. One way to accomplish this is to use a low drop-out voltage regulator.

4.2.2 Power Down Sequence

If IV_{DD}PLL V_{DD} are powered down first, sense circuits in the I/O pads cause all output drivers to be in a high impedance state. There is no limit on how long after IV_{DD} and PLL V_{DD} power down before EV_{DD} or SD V_{DD} must power down. IV_{DD} should not lag EV_{DD}, SD V_{DD}, or PLL V_{DD} going low by more than 0.4V during power down or there is undesired high current in the ESD protection diodes. There are no requirements for the fall times of the power supplies.

The recommended power down sequence is as follows:

1. Drop IV_{DD}/PLL V_{DD} to 0V
2. Drop EV_{DD}/SD V_{DD} supplies

4.3 General USB Layout Guidelines

4.3.1 USB D+ and D- High-Speed Traces

1. High speed clock and the USBD+ and USBD- differential pair should be routed first.
2. Route USBD+ and USBD- signals on the top layer of the board.
3. The trace width and spacing of the USBD+ and USBD- signals should be such that the differential impedance is 90Ω.
4. Route traces over continuous planes (power and ground)—they should not pass over any power/ground plane slots or anti-etch. When placing connectors, make sure the ground plane clear-outs around each pin have ground continuity between all pins.
5. Maintain the parallelism (skew matched) between USBD+ and USBD-. These traces should be the same overall length.
6. Do not route USBD+ and USBD- traces under oscillators or parallel to clock traces and/or data buses. Minimize the lengths of high speed signals that run parallel to the USBD+ and USBD- pair. Maintain a minimum 50mil spacing to clock signals.
7. Keep USBD+ and USBD- traces as short as possible.
8. Route USBD+, USBD-, and USBVBUS signals with a minimum amount of vias and corners. Use 45° turns.
9. Stubs should be avoided as much as possible. If they cannot be avoided, stubs should be no greater than 200mils.

4.3.2 USB VBUS Traces

Connecting the USBVBUS pin directly to the 5V VBUS signal from the USB connector can cause long-term reliability problems in the ESD network of the processor. Therefore, use of an external voltage divider for VBUS is recommended. Figure 4 and Figure 5 depict possible connections for VBUS. Point A, marked in each figure, is where a 5V version of VBUS should connect. Point B, marked in each figure, is where a 3.3V version of VBUS should connect to the USBVBUS pin on the device.

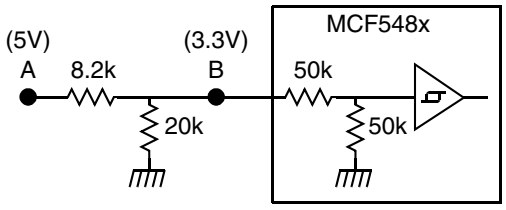


Figure 4. Preferred VBUS Connections

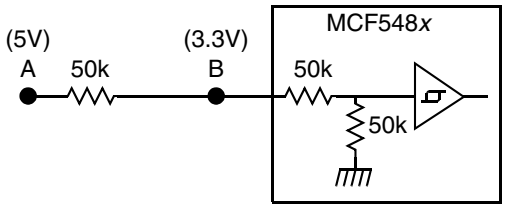

Figure 5. Alternate VBUS Connections

4.3.3 USB Receptacle Connections

It is recommended to connect the shield and the ground pin of the B USB receptacle for upstream ports to the board ground plane. The ground pin of the A USB receptacles for downstream ports should also be connected to the board ground plane, but industry practice varies widely on the connection of the shield of the A USB receptacles to other system grounds. Take precautions for control of ground loops between hosts and self-powered USB devices through the cable shield.

7 Reset Timing Specifications

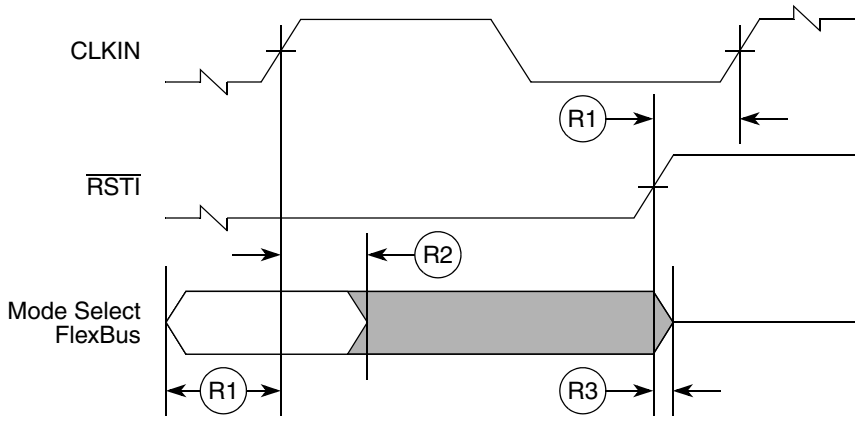
Table 9 lists specifications for the reset timing parameters shown in Figure 10

Table 9. Reset Timing Specifications

Num	Characteristic	50 MHz CLKIN		Units
		Min	Max	
R1[1]	Valid to CLKIN (setup)	8	—	ns
R2	CLKIN to invalid (hold)	1.0	—	ns
R3	$\overline{\text{RSTI}}$ to invalid (hold)	1.0	—	ns
	$\overline{\text{RSTI}}$ pulse duration	5	—	CLKIN cycles

1 $\overline{\text{RSTI}}$ and FlexBus data lines are synchronized internally. Setup and hold times must be met only if recognition on a particular clock is required.

Figure 10 shows reset timing for the values in Table 9.



NOTE:
Mode selects are registered on the rising clock edge before the cycle in which $\overline{\text{RSTI}}$ is recognized as being negated.

Figure 10. Reset Timing

8 FlexBus

A multi-function external bus interface called FlexBus is provided on the MCF5482 with basic functionality to interface to slave-only devices up to a maximum bus frequency of 66 MHz. It can be directly connected to asynchronous or synchronous devices such as external boot ROMs, flash memories, gate-array logic, or other simple target (slave) devices with little or no additional circuitry. For asynchronous devices, a simple chip-select based interface can be used. The FlexBus interface has six general purpose chip-selects ($\overline{\text{FBCS}}$[5:0]). Chip-select $\overline{\text{FBCS0}}$ can be dedicated to boot ROM access and can be programmed to be byte (8 bits), word (16 bits), or longword (32 bits) wide. Control signal timing is compatible with common ROM / flash memories.

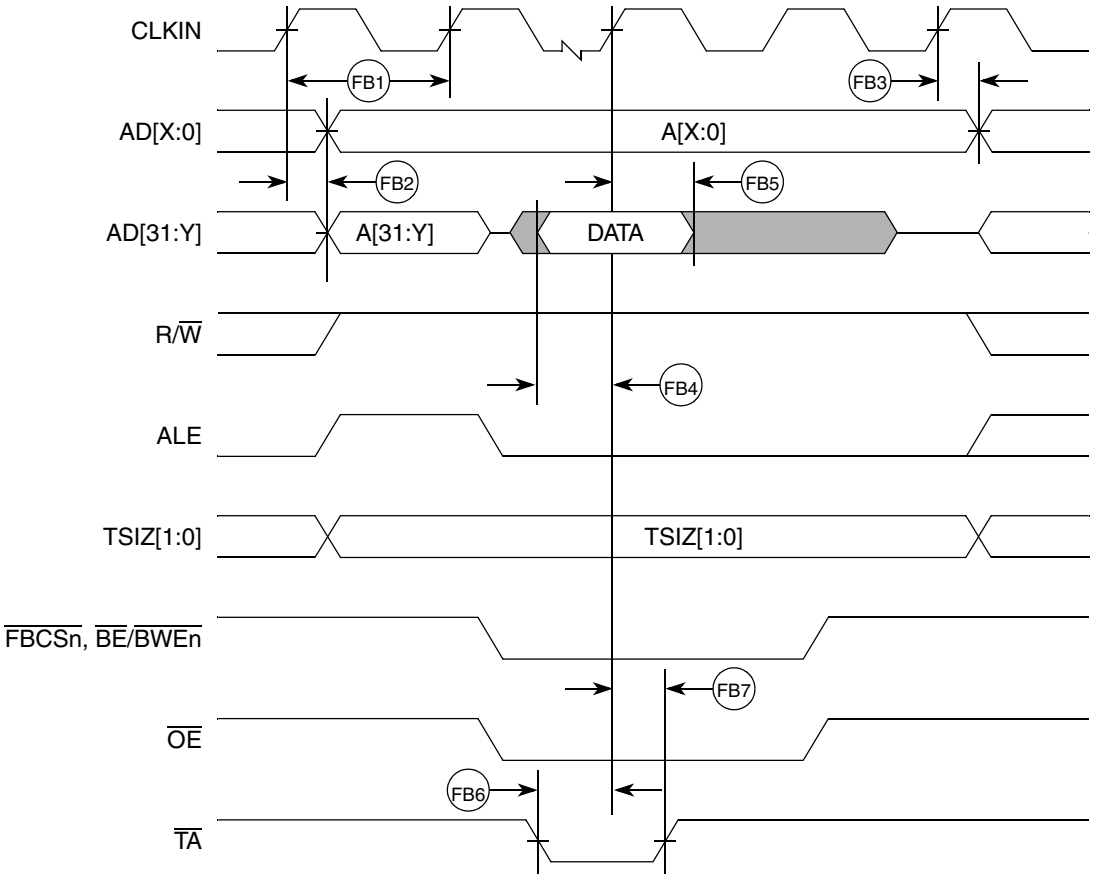


Figure 11. FlexBus Read Timing

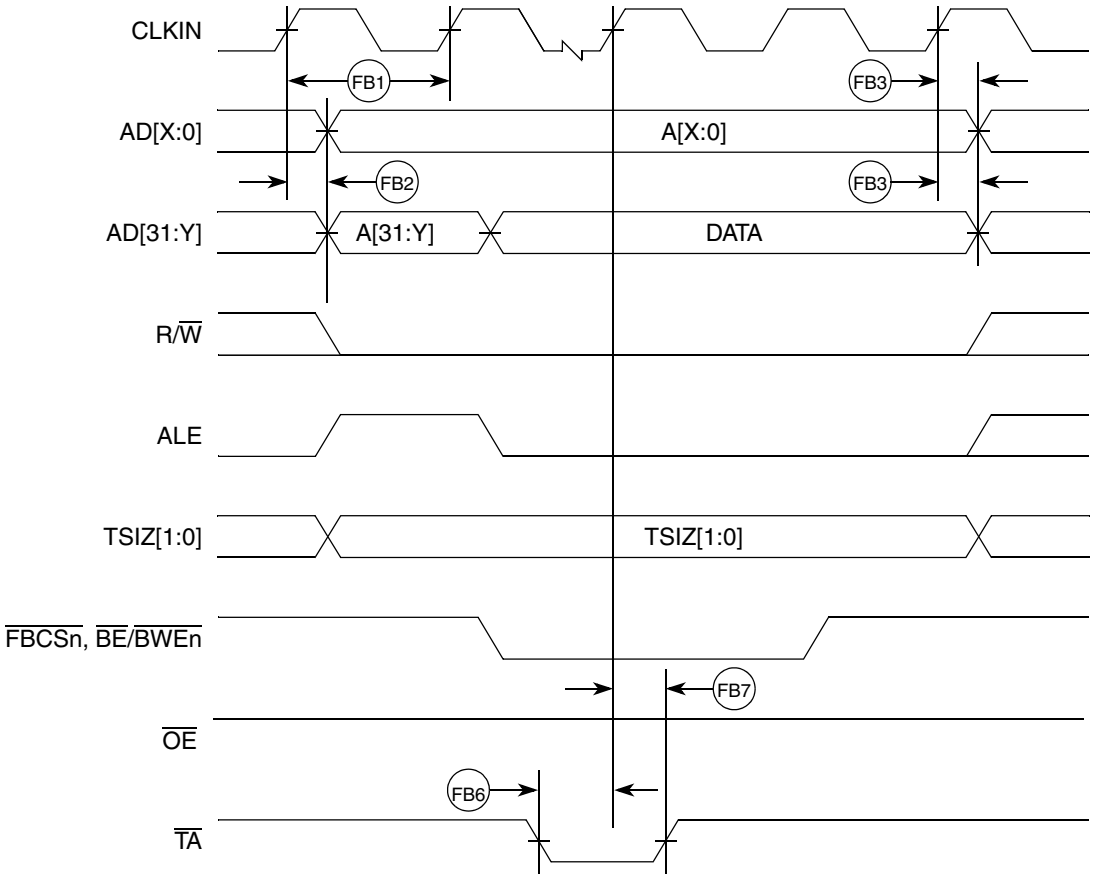

Figure 12. FlexBus Write Timing

9 SDRAM Bus

The SDRAM controller supports accesses to main SDRAM memory from any internal master. It supports standard SDRAM or double data rate (DDR) SDRAM, but it does not support both at the same time. The SDRAM controller uses SSTL2 and SSTL3 I/O drivers. Both SSTL drive modes are programmable for Class I or Class II drive strength.

9.1 SDR SDRAM AC Timing Characteristics

The following timing numbers indicate when data is latched or driven onto the external bus, relative to the memory bus clock, when operating in SDR mode on write cycles and relative to SDR_DQS on read cycles. The MCF548*x* SDRAM controller is a DDR controller that has an SDR mode. Because it is designed to support DDR, a DQS pulse must be supplied to the MCF548*x* for each data beat of an SDR read. The MCF548*x* accomplishes this by asserting a signal called SDR_DQS during read cycles. Care must be taken during board design to adhere to the following guidelines and specs with regard to the SDR_DQS signal and its usage.

Table 11. SDR Timing Specifications

Symbol	Characteristic	Min	Max	Unit	Notes
	Frequency of Operation	0	133	Mhz	1
SD1	Clock Period (t_{CK})	7.52	12	ns	2
SD2	Clock Skew (t_{SK})		TBD		
SD3	Pulse Width High (t_{CKH})	0.45	0.55	SDCLK	3
SD4	Pulse Width Low (t_{CKL})	0.45	0.55	SDCLK	4
SD5	Address, CKE, CAS, RAS, WE, BA, CS - Output Valid (t_{CMV})		0.5 × SDCLK + 1.0ns	ns	
SD6	Address, CKE, CAS, RAS, WE, BA, CS - Output Hold (t_{CMH})	2.0		ns	
SD7	SDRDQS Output Valid (t_{DQSOV})		Self timed	ns	5
SD8	SDDQS[3:0] input setup relative to SDCLK (t_{DQSIS})	0.25 × SDCLK	0.40 × SDCLK	ns	6
SD9	SDDQS[3:0] input hold relative to SDCLK (t_{DQSIH})	Does not apply. 0.5 SDCLK fixed width.			7
SD10	Data Input Setup relative to SDCLK (reference only) (t_{DIS})	0.25 × SDCLK		ns	8
SD11	Data Input Hold relative to SDCLK (reference only) (t_{DIH})	1.0		ns	
SD12	Data and Data Mask Output Valid (t_{DV})		0.75 × SDCLK +0.500ns	ns	
SD13	Data and Data Mask Output Hold (t_{DH})	1.5		ns	

1 The frequency of operation is 2x or 4x the CLKIN frequency of operation. The MCF548X supports a single external reference clock (CLKIN). This signal defines the frequency of operation for FlexBus and PCI, but SDRAM clock operates at the same frequency as the internal bus clock. Please see the PLL chapter of the *MCF548X Reference Manual* for more information on setting the SDRAM clock rate.

2 SDCLK is one SDRAM clock in (ns).

3 Pulse width high plus pulse width low cannot exceed min and max clock period.

4 Pulse width high plus pulse width low cannot exceed min and max clock period.

5 SDR_DQS is designed to pulse 0.25 clock before the rising edge of the memory clock. This is a guideline only. Subtle variation from this guideline is expected. SDR_DQS only pulses during a read cycle and one pulse occurs for each data beat.

6 SDR_DQS is designed to pulse 0.25 clock before the rising edge of the memory clock. This spec is a guideline only. Subtle variation from this guideline is expected. SDR_DQS only pulses during a read cycle and one pulse occurs for each data beat.

7 The SDR_DQS pulse is designed to be 0.5 clock in width. The timing of the rising edge is most important. The falling edge does not affect the memory controller.

8 Because a read cycle in SDR mode uses the DQS circuit within the MCF548X, it is most critical that the data valid window be centered 1/4 clk after the rising edge of DQS. Ensuring that this happens results in successful SDR reads. The input setup spec is provided as guidance.

9.2 DDR SDRAM AC Timing Characteristics

When using the DDR SDRAM controller, the following timing numbers must be followed to properly latch or drive data onto the memory bus. All timing numbers are relative to the four DQS byte lanes.

Table 12shows the DDR clock crossover specifications.

Table 12. DDR Clock Crossover Specifications

Symbol	Characteristic	Min	Max	Unit
V_{MP}	Clock output mid-point voltage	1.05	1.45	V
V_{OUT}	Clock output voltage level	–0.3	SD_VDD + 0.3	V
V_{ID}	Clock output differential voltage (peak to peak swing)	0.7	SD_VDD + 0.6	V
V_{IX}	Clock crossing point voltage[1]	1.05	1.45	V

[1] The clock crossover voltage is only guaranteed when using the highest drive strength option for the SDCLK[1:0] and $\overline{\text{SDCLK}}$[1:0] signals.

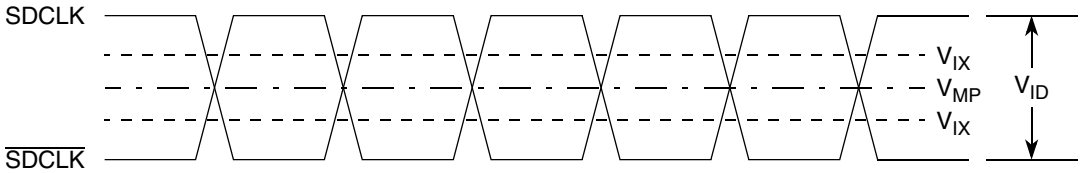

Figure 15. DDR Clock Timing Diagram

Table 13. DDR Timing Specifications

Symbol	Characteristic	Min	Max	Unit	Notes
	Frequency of Operation	50[1]	133	MHz	2
DD1	Clock Period (t_{CK})	7.52	12	ns	3
DD2	Pulse Width High (t_{CKH})	0.45	0.55	SDCLK	4
DD3	Pulse Width Low (t_{CKL})	0.45	0.55	SDCLK	5
DD4	Address, SDCKE, $\overline{\text{CAS}}$, $\overline{\text{RAS}}$, $\overline{\text{WE}}$, SDBA, $\overline{\text{SDCS}}$—Output Valid (t_{CMV})	—	0.5 × SDCLK + 1.0 ns	ns	6
DD5	Address, SDCKE, $\overline{\text{CAS}}$, $\overline{\text{RAS}}$, $\overline{\text{WE}}$, SDBA, $\overline{\text{SDCS}}$—Output Hold (t_{CMH})	2.0	—	ns	
DD6	Write Command to first DQS Latching Transition (t_{DQSS})	—	1.25	SDCLK	
DD7	Data and Data Mask Output Setup (DQ–>DQS) Relative to DQS (DDR Write Mode) (t_{QS})	1.0	—	ns	7 8
DD8	Data and Data Mask Output Hold (DQS–>DQ) Relative to DQS (DDR Write Mode) (t_{QH})	1.0	—	ns	9
DD9	Input Data Skew Relative to DQS (Input Setup) (t_{IS})		1	ns	10
DD10	Input Data Hold Relative to DQS (t_{IH})	0.25 × SDCLK + 0.5ns	—	ns	11
DD11	DQS falling edge to SDCLK rising (output setup time) (t_{DSS})	0.5	—	ns	
DD12	DQS falling edge from SDCLK rising (output hold time) (t_{DSH})	0.5	—	ns	

Table 13. DDR Timing Specifications (continued)

Symbol	Characteristic	Min	Max	Unit	Notes
DD13	DQS input read preamble width (t_{RPRE})	0.9	1.1	SDCLK	
DD14	DQS input read postamble width (t_{RPST})	0.4	0.6	SDCLK	
DD15	DQS output write preamble width (t_{WPRE})	0.25	—	SDCLK	
DD16	DQS output write postamble width (t_{WPST})	0.4	0.6	SDCLK	

1 DDR memories typically have a minimum speed specification of 83 MHz. Check memory component specifications to verify.

2 The frequency of operation is 2x or 4x the CLKIN frequency of operation. The MCF548X supports a single external reference clock (CLKIN). This signal defines the frequency of operation for FlexBus and PCI, but SDRAM clock operates at the same frequency as the internal bus clock. Please see the reset configuration signals description in the “Signal Descriptions” chapter within the *MCF548x Reference Manual*.

3 SDCLK is one memory clock in (ns).

4 Pulse width high plus pulse width low cannot exceed max clock period.

5 Pulse width high plus pulse width low cannot exceed max clock period.

6 Command output valid should be 1/2 the memory bus clock (SDCLK) plus some minor adjustments for process, temperature, and voltage variations.

7 This specification relates to the required input setup time of today’s DDR memories. SDDATA[31:24] is relative to SDDQS3, SDDATA[23:16] is relative to SDDQS2, SDDATA[15:8] is relative to SDDQS1, and SDDATA[7:0] is relative SDDQS0.

8 The first data beat is valid before the first rising edge of SDDQS and after the SDDQS write preamble. The remaining data beats is valid for each subsequent SDDQS edge.

9 This specification relates to the required hold time of today’s DDR memories. SDDATA[31:24] is relative to SDDQS3, SDDATA[23:16] is relative to SDDQS2, SDDATA[15:8] is relative to SDDQS1, and SDDATA[7:0] is relative SDDQS0.

10 Data input skew is derived from each SDDQS clock edge. It begins with a SDDQS transition and ends when the last data line becomes valid. This input skew must include DDR memory output skew and system level board skew (due to routing or other factors).

11 Data input hold is derived from each SDDQS clock edge. It begins with a SDDQS transition and ends when the first data line becomes invalid.

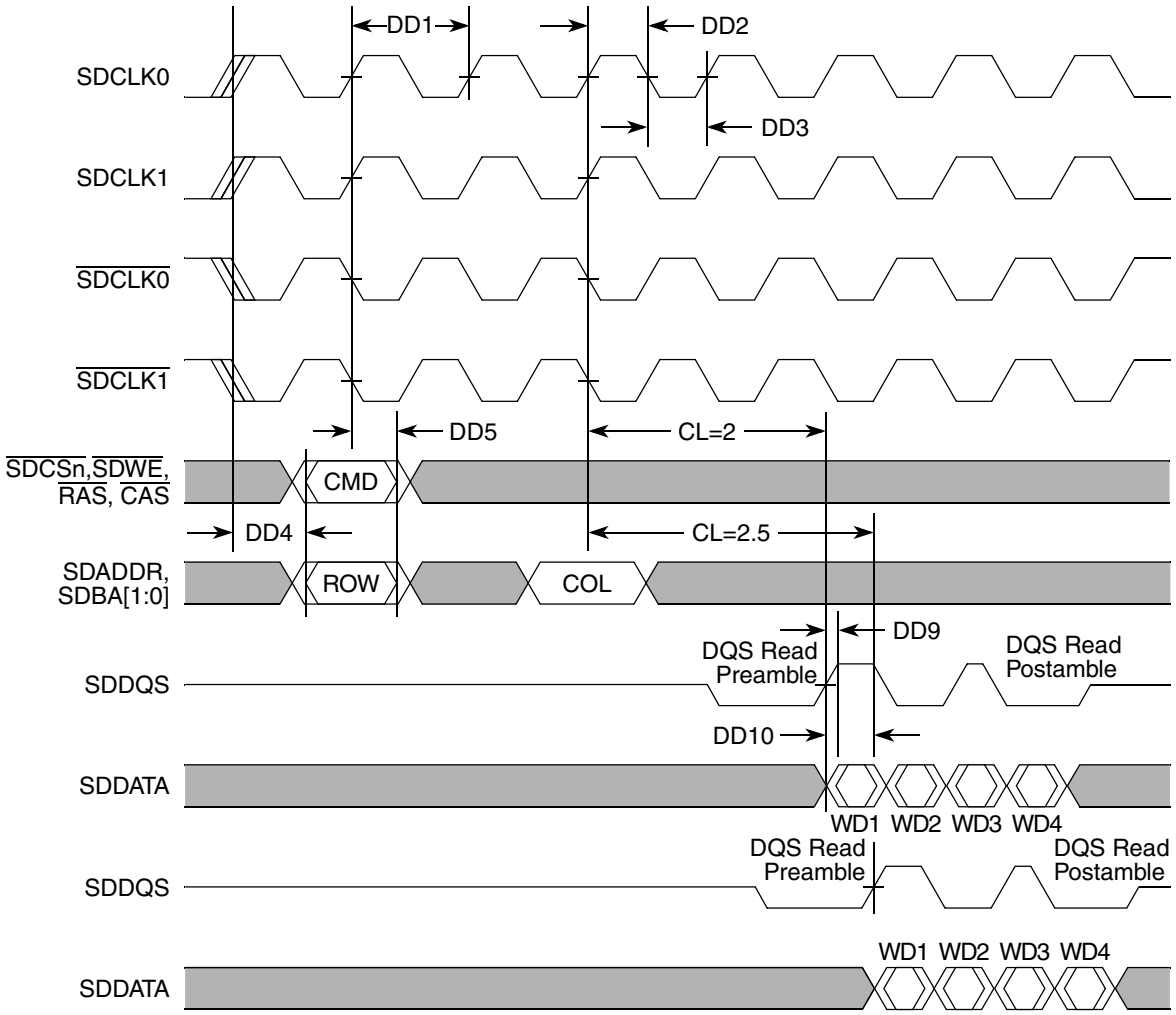

Figure 17. DDR Read Timing

10 PCI Bus

The PCI bus on the MCF548*x* is PCI 2.2 compliant. The following timing numbers are mostly from the PCI 2.2 spec. Please refer to the PCI 2.2 spec for a more detailed timing analysis.

Table 14. PCI Timing Specifications

Num	Characteristic	Min	Max	Unit	Notes
	Frequency of Operation	25	50	MHz	1
P1	Clock Period (t_{CK})	20	40	ns	2
P2	Address, Data, and Command (33< PCI ≤ 50 Mhz)—Input Setup (t_{IS})	3.0	—	ns	
P3	Address, Data, and Command (0 < PCI ≤ 33 Mhz)—Input Setup (t_{IS})	7.0	—	ns	
P4	Address, Data, and Command (33–50 Mhz)—Output Valid (t_{DV})	—	6.0	ns	3
P5	Address, Data, and Command (0–33 Mhz) - Output Valid (t_{DV})	—	11.0	ns	
P6	PCI signals (0–50 Mhz) - Output Hold (t_{DH})	0	—	ns	4

Table 14. PCI Timing Specifications (continued)

Num	Characteristic	Min	Max	Unit	Notes
P7	PCI signals (0–50 Mhz) - Input Hold (t_{IH})	0	—	ns	5
P8	PCI REQ/GNT (33 < PCI ≤ 50Mhz) - Output valid (t_{DV})	—	6	ns	6
P9	PCI REQ/GNT (0 < PCI ≤ 33Mhz) - Output valid (t_{DV})	—	12	ns	
P10	PCI REQ/GNT (33 < PCI ≤ 50Mhz) - Input Setup (t_{IS})	—	5	ns	
P11	PCI REQ (0 < PCI ≤ 33Mhz) - Input Setup (t_{IS})	12	—	ns	
P12	PCI GNT (0 < PCI ≤ 33Mhz) - Input Setup (t_{IS})	10	—	ns	

1 Please see the reset configuration signals description in the “Signal Descriptions” chapter within the *MCF548x Reference Manual*. Also specific guidelines may need to be followed when operating the system PLL below certain frequencies.

2 Max cycle rate is determined by CLKIN and how the user has the system PLL configured.

3 All signals defined as PCI bused signals. Does not include PTP (point-to-point) signals.

4 PCI 2.2 spec does not require an output hold time. Although the MCF548X may provide a slight amount of hold, it is not required or guaranteed.

5 PCI 2.2 spec requires zero input hold.

6 These signals are defined at PTP (Point-to-point) in the PCI 2.2 spec.

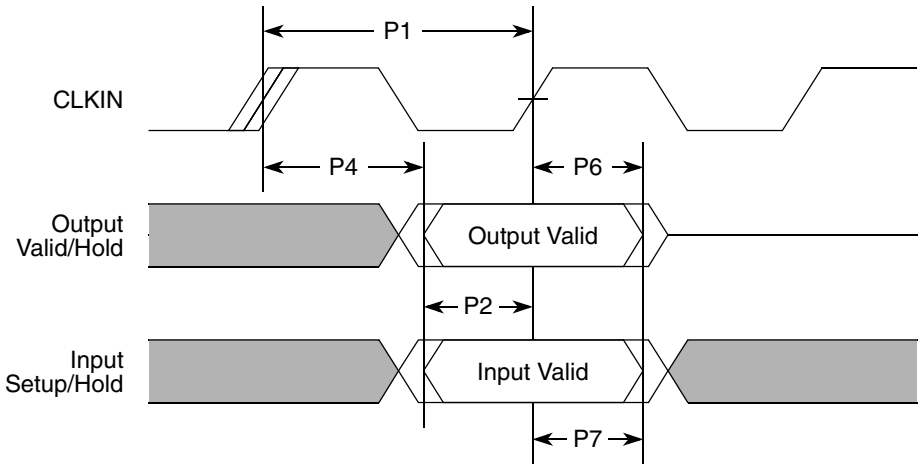

Figure 18. PCI Timing

11 Fast Ethernet AC Timing Specifications

11.1 MII/7-WIRE Interface Timing Specs

The following timing specs are defined at the chip I/O pin and must be translated appropriately to arrive at timing specs/constraints for the EMAC_10_100 I/O signals.

The following timing specs meet the requirements for MII and 7-Wire style interfaces for a range of transceiver devices. If this interface is to be used with a specific transceiver device the timing specs may be altered to match that specific transceiver.

11.3 MII Async Inputs Signal Timing (CRS, COL)

Table 17. MII Transmit Signal Timing

Num	Characteristic	Min	Max	Unit
M9	CRS, COL minimum pulse width	1.5	—	TX_CLK period

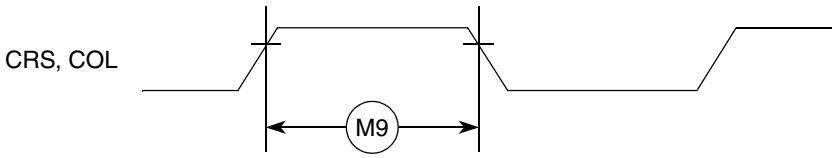

Figure 21. MII Async Inputs Timing Diagram

11.4 MII Serial Management Channel Timing (MDIO,MDC)

Table 18. MII Serial Management Channel Signal Timing

Num	Characteristic	Min	Max	Unit
M10	MDC falling edge to MDIO output invalid (min prop delay)	0	—	ns
M11	MDC falling edge to MDIO output valid (max prop delay)	—	25	ns
M12	MDIO (input) to MDC rising edge setup	10	—	ns
M13	MDIO (input) to MDC rising edge hold	0	—	ns
M14	MDC pulse width high	40%	60%	MDC period
M15	MDC pulse width low	40%	60%	MDC period

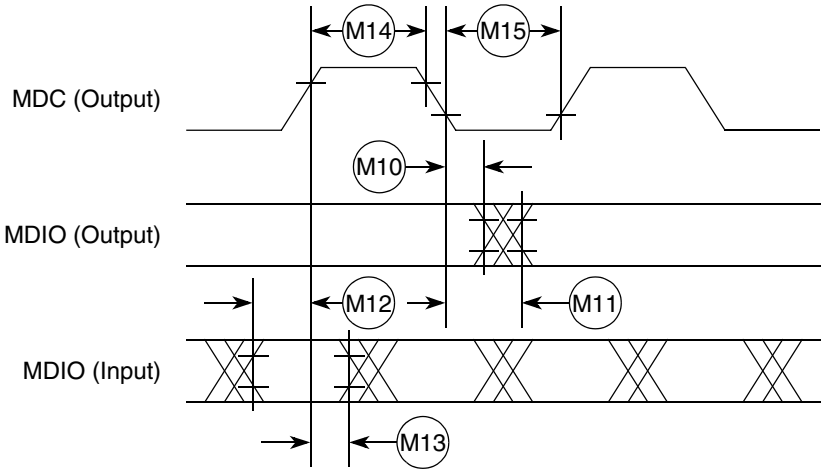

Figure 22. MII Serial Management Channel TIming Diagram

12 General Timing Specifications

Table 19 lists timing specifications for the GPIO, PSC, FlexCAN, $\overline{\text{DREQ}}$, $\overline{\text{DACK}}$, and external interrupts.

Table 19. General AC Timing Specifications

Name	Characteristic	Min	Max	Unit
G1	CLKIN high to signal output valid	—	2	PSTCLK
G2	CLKIN high to signal invalid (output hold)	0	—	ns
G3	Signal input pulse width	2	—	PSTCLK

13 I^2C Input/Output Timing Specifications

Table 20 lists specifications for the I^2C input timing parameters shown in Figure 23.

Table 20. I^2C Input Timing Specifications between SCL and SDA

Num	Characteristic	Min	Max	Units
I1	Start condition hold time	2	—	Bus clocks
I2	Clock low period	8	—	Bus clocks
I3	SCL/SDA rise time (V_{IL} = 0.5 V to V_{IH} = 2.4 V)	—	1	mS
I4	Data hold time	0	—	ns
I5	SCL/SDA fall time (V_{IH} = 2.4 V to V_{IL} = 0.5 V)	—	1	mS
I6	Clock high time	4	—	Bus clocks
I7	Data setup time	0	—	ns
I8	Start condition setup time (for repeated start condition only)	2	—	Bus clocks
I9	Stop condition setup time	2	—	Bus clocks

Table 21 lists specifications for the I^2C output timing parameters shown in Figure 23.

Table 21. I^2C Output Timing Specifications between SCL and SDA

Num	Characteristic	Min	Max	Units
I1[1]	Start condition hold time	6	—	Bus clocks
I2[1]	Clock low period	10	—	Bus clocks
I3[2]	SCL/SDA rise time (V_{IL} = 0.5 V to V_{IH} = 2.4 V)	—	—	μS
I4[1]	Data hold time	7	—	Bus clocks
I5[3]	SCL/SDA fall time (V_{IH} = 2.4 V to V_{IL} = 0.5 V)	—	3	ns
I6[1]	Clock high time	10	—	Bus clocks
I7[1]	Data setup time	2	—	Bus clocks
I8[1]	Start condition setup time (for repeated start condition only)	20	—	Bus clocks
I9[1]	Stop condition setup time	10	—	Bus clocks

Table 23 lists specifications for the debug AC timing parameters shown in Figure 29.

Table 23. Debug AC Timing Specifications

Num	Characteristic	50 MHz		Units
		Min	Max	
D1	PSTDDATA to PSTCLK setup	4.5	—	ns
D2	PSTCLK to PSTDDATA hold	4.5	—	ns
D3	DSI-to-DSCLK setup	1	—	PSTCLKs
D4 [1]	DSCLK-to-DSO hold	4	—	PSTCLKs
D5	DSCLK cycle time	5	—	PSTCLKs

[1] DSCLK and DSI are synchronized internally. D4 is measured from the synchronized DSCLK input relative to the rising edge of CLKOUT.

Figure 28 shows real-time trace timing for the values in Table 23.

TITLE: 388 I/O, PBGA 27 X 27 PKG, 1 MM PITCH (OMPAC)	DOCUMENT NO: 98ARS23880W	REV: C
	CASE NUMBER: 1164–02	25 JAN 2007
	STANDARD: JEDEC MS–034 AAL–1	

Figure 31. 388-pin BGA Case Outline

18 Revision History

Revision Number	Date	Substantive Changes
2.2	August 29, 2005	Table 7: Changed C1 minimum spec from 15.15 ns to 20 ns and maximum spec from 33.3 ns to 40 ns.
2.3	August 30, 2005	Table 22: Changed J11 maximum from 15 ns to 20 ns.
2.4	December 14, 2005	Table 9: Changed heading maximum from 66 MHz to 50 MHz. Table 10: Changed frequency of operation maximum from 66 MHz to 50 MHz and corresponding FB1 minimum from 15.15 ns to 20 ns. Table 10: Changed FB1 maximum from 33.33 ns to 40 ns. Table 14: Changed frequency of operation maximum from 66 MHz to 50 MHz and corresponding FB1 minimum from 15.15 ns to 20 ns. Table 14: Changed FB1 maximum from 33.33 ns to 40 ns. Table 14: Changed various entry descriptions from “(33 < PCI ≤ 66 Mhz)” to (33< PCI ≤ 50 Mhz) Table 23: Changed heading maximum from 66 MHz to 50 MHz. Table 25: Changed heading maximum from 66 MHz to 50 MHz.
3	February 20, 2007	Table 4: Updated DC electrical specifications, V_{IL} and V_{IH}. Table 6: Changed FlexBus output load from 20pF to 30pF. Added Section 4.3, “General USB Layout Guidelines.”
4	December 4, 2007	Figure 2: Changed resistor value from 10W to 10Ω Figure 3: Changed note 1 in from “IVDD should not exceed EVDD, SD VDD or PLL VDD by more than 0.4V...” to “IVDD should not exceed EVDD or SD VDD by more than 0.4V...” Table 3: Updated thermal information for θ_{JMA}, θ_{JB}, and θ_{JC} Table 4: Added input leakage current spec. Table 6: Added footnote regarding pads having balanced source & sink current. Table 9: Added $\overline{\text{RSTI}}$ pulse duration spec. Added features list, pinout drawing, block diagram, and case outline.
