Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	ARM® Cortex®-M4F
Core Size	32-Bit Single-Core
Speed	80MHz
Connectivity	CANbus, FlexIO, I²C, LINbus, SPI, UART/USART
Peripherals	POR, PWM, WDT
Number of I/O	58
Program Memory Size	1MB (1M x 8)
Program Memory Type	FLASH
EEPROM Size	4K x 8
RAM Size	128K x 8
Voltage - Supply (Vcc/Vdd)	2.7V ~ 5.5V
Data Converters	A/D 24x12b SAR; D/A1x8b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 105°C (TA)
Mounting Type	Surface Mount
Package / Case	64-LQFP
Supplier Device Package	64-LQFP (10x10)

3 Ordering information

3.1 Selecting orderable part number

Not all part number combinations are available. See the attachment *S32K1xx_Orderable_Part_Number_ List.xlsx* attached with the Datasheet for a list of standard orderable part numbers.

4 General

4.1 Absolute maximum ratings

NOTE

- Functional operating conditions appear in the DC electrical characteristics. Absolute maximum ratings are stress ratings only, and functional operation at the maximum values is not guaranteed. See footnotes in the following table for specific conditions.
- Stress beyond the listed maximum values may affect device reliability or cause permanent damage to the device.
- All the limits defined in the datasheet specification must be honored together and any violation to any one or more will not guarantee desired operation.
- Unless otherwise specified, all maximum and minimum values in the datasheet are across process, voltage, and temperature.

Table 1. Absolute maximum ratings

Symbol	Parameter	Conditions[1]	Min	Max	Unit
V_{DD}[2]	2.7 V - 5. 5V input supply voltage	—	-0.3	5.8 [3]	V
V_{REFH}	3.3 V / 5.0 V ADC high reference voltage	—	-0.3	5.8 [3]	V
$I_{INJPAD\_DC\_ABS}$[4]	Continuous DC input current (positive / negative) that can be injected into an I/O pin	—	-3	+3	mA
V_{IN_DC}	Continuous DC Voltage on any I/O pin with respect to V_{SS}	—	-0.8	5.8[5]	V
$I_{INJSUM\_DC\_ABS}$	Sum of absolute value of injected currents on all the pins (Continuous DC limit)	—	—	30	mA
T_{ramp}[6]	ECU supply ramp rate	—	0.5 V/min	500 V/ms	—
T_{ramp_MCU}[7]	MCU supply ramp rate	—	0.5 V/min	100 V/ms	—
T_A[8]	Ambient temperature	—	-40	125	°C
T_{STG}	Storage temperature	—	-55	165	°C
$V_{IN\_TRANSIENT}$	Transient overshoot voltage allowed on I/O pin beyond $V_{IN\_DC\ limit}$	—	—	6.8 [9]	V

1. All voltages are referred to V_{SS} unless otherwise specified.
2. As V_{DD} varies between the minimum value and the absolute maximum value the analog characteristics of the I/O and the ADC will both change. See section I/O parameters and ADC electrical specifications respectively for details.
3. 60 s lifetime – No restrictions i.e. The part can switch.

   10 hours lifetime – Device in reset i.e. The part cannot switch.

1. Typical current numbers are indicative for typical silicon process and may vary based on the silicon distribution and user configuration. Typical conditions assumes $V_{DD} = V_{DDA} = V_{REFH} = 5$ V, temperature = 25 °C and typical silicon process unless otherwise stated. All output pins are floating and On-chip pulldown is enabled for all unused input pins.
2. Current numbers are for reduced configuration and may vary based on user configuration and silicon process variation.
3. HSRUN mode must not be used at 125°C. Max ambient temperature for HSRUN mode is 105°C.
4. Values mentioned for S32K14x devices are measured at RUN@80 MHz with peripherals disabled and values mentioned for S32K11x devices are measured at RUN@48 MHz with peripherals disabled.
5. With PMC_REGSC[CLKBIASDIS] set to 1. See Reference Manual for details.
6. Data collected using RAM
7. Numbers on limited samples size and data collected with Flash
8. The S32K148 data points assume that ENET/QuadSPI/SAI etc. are inactive.

The following table shows the power consumption targets for S32K148 in various mode of operations measure at 3.3 V.

1. S32K148 will operate from 2.7 V when executing from internal FIRC. When the PLL is engaged S32K148 is guaranteed to operate from 2.97 V. All other S32K family devices operate from 2.7 V in all modes.
2. For reset pads, same V_{ih} levels are applicable
3. For reset pads, same V_{il} levels are applicable
4. The value given is measured at high drive strength mode. For value at low drive strength mode see the Ioh_Standard value given above.
5. For refernce only. Run simulations with the IBIS model and custom board for accurate results.

5. Several I/O have both high drive and normal drive capability selected by the associated Portx_PCRn[DSE] control bit. All other GPIOs are normal drive only. For details refer to *SK3K144_IO_Signal_Description_Input_Multiplexing.xlsx* attached with the *Reference Manual*.
6. Measured at input V = V_{SS}
7. Measured at input V = V_{DD}

1. All command times assumes 25 MHz or greater flash clock frequency (for synchronization time between internal/external clocks).
2. Maximum times for erase parameters based on expectations at cycling end-of-life.
3. For all EEPROM Emulation terms, the specified timing shown assumes previous record cleanup has occurred. This may be verified by executing FCCOB Command 0x77, and checking FCCOB number 5 contents show 0x00 - No EEPROM issues detected.
4. 1st time EERAM writes after a Reset or SETRAM may incur additional overhead for EEE cleanup, resulting in up to 2× the times shown.
5. Only after the Nth write completes will any data be valid. Emulated EEPROM record scheme cleanup overhead may occur after this point even after a brownout or reset. If power on reset occurs before the Nth write completes, the last valid record set will still be valid and the new records will be discarded.
6. Quick Write times may take up to 550 µs, as additional cleanup may occur when crossing sector boundaries.
7. Time for emulated EEPROM record scheme overhead cleanup. Automatically done after last (Nth) write completes, assuming still powered. Or via SETRAM cleanup execution command is requested at a later point.

The following table describes the MDIO electrical characteristics.

- Measurements are with maximum output load of 25 pF, input transition of 1 ns and pad configured with fastest slew settings (DSE = 1'b1).
- I/O operating voltage ranges from 2.97 V to 3.6 V
- While doing the mode transition (RUN -> HSRUN or HSRUN -> RUN), the interface should be OFF.
- MDIO pin must have external Pull-up.

1. Junction temperature is a function of die size, on-chip power dissipation, package thermal resistance, mounting site (board) temperature, ambient temperature, air flow, power dissipation of other components on the board, and board thermal resistance.
2. Per SEMI G38-87 and JEDEC JESD51-2 with the single layer board horizontal.
3. Per JEDEC JESD51-6 with the board horizontal.
4. Thermal resistance between the die and the printed circuit board per JEDEC JESD51-8. Board temperature is measured on the top surface of the board near the package.
5. Thermal resistance between the die and the case top surface as measured by the cold plate method (MIL SPEC-883 Method 1012.1).
6. Thermal characterization parameter indicating the temperature difference between package top and the junction temperature per JEDEC JESD51-2. When Greek letters are not available, the thermal characterization parameter is written as Psi-JT.
7. Thermal characterization parameter indicating the temperature difference between package bottom center and the junction temperature per JEDEC JESD51-12. When Greek letters are not available, the thermal characterization parameter is written as Psi-JB.

To determine the junction temperature of the device in the application when heat sinks are not used, the Thermal Characterization Parameter (Ψ_{JT}) can be used to determine the junction temperature with a measurement of the temperature at the top center of the package case using this equation:

$$T_J = T_T + (\Psi_{JT} \times P_D)$$

where:

- T_T = thermocouple temperature on top of the package (°C)
- Ψ_{JT} = thermal characterization parameter (°C/W)
- P_D = power dissipation in the package (W)

The thermal characterization parameter is measured per JESD51-2 specification using a 40 gauge type T thermocouple epoxied to the top center of the package case. The thermocouple should be positioned so that the thermocouple junction rests on the package. A small amount of epoxy is placed over the thermocouple junction and over about 1 mm of wire extending from the junction. The thermocouple wire is placed flat against the package case to avoid measurement errors caused by cooling effects of the thermocouple wire.
