What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Details

Product Status	Active
Core Processor	ARM® Cortex®-M4F
Core Size	32-Bit Single-Core
Speed	112MHz
Connectivity	CANbus, Ethernet, FlexIO, I ² C, LINbus, SPI, UART/USART
Peripherals	I ² S, POR, PWM, WDT
Number of I/O	128
Program Memory Size	2MB (2M x 8)
Program Memory Type	FLASH
EEPROM Size	4K x 8
RAM Size	256K x 8
Voltage - Supply (Vcc/Vdd)	2.7V ~ 5.5V
Data Converters	A/D 32x12b SAR; D/A 1x8b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 105°C (TA)
Mounting Type	Surface Mount
Package / Case	144-LQFP
Supplier Device Package	144-LQFP (20x20)

4 General

4.1 Absolute maximum ratings

NOTE

- Functional operating conditions appear in the DC electrical characteristics. Absolute maximum ratings are stress ratings only, and functional operation at the maximum values is not guaranteed. See footnotes in the following table for specific conditions.
- Stress beyond the listed maximum values may affect device reliability or cause permanent damage to the device.
- All the limits defined in the datasheet specification must be honored together and any violation to any one or more will not guarantee desired operation.
- Unless otherwise specified, all maximum and minimum values in the datasheet are across process, voltage, and temperature.

Table 1. Absolute maximum ratings

Symbol	Parameter	Conditions ¹	Min	Max	Unit
V_{DD} ²	2.7 V - 5.5V input supply voltage	—	-0.3	5.8 ³	V
V_{REFH}	3.3 V / 5.0 V ADC high reference voltage	—	-0.3	5.8 ³	V
$I_{INJPAD_DC_ABS}$ ⁴	Continuous DC input current (positive / negative) that can be injected into an I/O pin	—	-3	+3	mA
V_{IN_DC}	Continuous DC Voltage on any I/O pin with respect to V_{SS}	—	-0.8	5.8 ⁵	V
$I_{INJSUM_DC_ABS}$	Sum of absolute value of injected currents on all the pins (Continuous DC limit)	—	—	30	mA
T_{ramp} ⁶	ECU supply ramp rate	—	0.5 V/min	500 V/ms	—
T_{ramp_MCU} ⁷	MCU supply ramp rate	—	0.5 V/min	100 V/ms	—
T_A ⁸	Ambient temperature	—	-40	125	°C
T_{STG}	Storage temperature	—	-55	165	°C
$V_{IN_TRANSIENT}$	Transient overshoot voltage allowed on I/O pin beyond V_{IN_DC} limit	—	—	6.8 ⁹	V

1. All voltages are referred to V_{SS} unless otherwise specified.
2. As V_{DD} varies between the minimum value and the absolute maximum value the analog characteristics of the I/O and the ADC will both change. See section [I/O parameters](#) and [ADC electrical specifications](#) respectively for details.
3. 60 s lifetime – No restrictions i.e. The part can switch.
10 hours lifetime – Device in reset i.e. The part cannot switch.

General

4. When input pad voltage levels are close to V_{DD} or V_{SS} , practically no current injection is possible.
5. While respecting the maximum current injection limit
6. This is the Electronic Control Unit (ECU) supply ramp rate and not directly the MCU ramp rate. Limit applies to both maximum absolute maximum ramp rate and typical operating conditions.
7. This is the MCU supply ramp rate and the ramp rate assumes that the S32K1xx HW design guidelines in AN5426 are followed. Limit applies to both maximum absolute maximum ramp rate and typical operating conditions.
8. T_J (Junction temperature)=135 °C. Assumes T_A =125 °C for RUN mode
 T_J (Junction temperature)=125 °C. Assumes T_A =105 °C for HSRUN mode
 - Assumes maximum θ_{JA} for 2s2p board. See [Thermal characteristics](#)
9. 60 seconds lifetime; device in reset (no outputs enabled/toggling)

4.2 Voltage and current operating requirements

NOTE

Device functionality is guaranteed up to the LVR assert level, however electrical performance of 12-bit ADC, CMP with 8-bit DAC, IO electrical characteristics, and communication modules electrical characteristics would be degraded when voltage drops below 2.7 V

Table 2. Voltage and current operating requirements 1

Symbol	Description	Min.	Max.	Unit	Notes
V_{DD} ²	Supply voltage	2.7 ³	5.5	V	4
V_{DD_OFF}	Voltage allowed to be developed on V_{DD} pin when it is not powered from any external power supply source.	0	0.1	V	
V_{DDA}	Analog supply voltage	2.7	5.5	V	4
$V_{DD} - V_{DDA}$	V_{DD} -to- V_{DDA} differential voltage	-0.1	0.1	V	4
V_{REFH}	ADC reference voltage high	2.7	$V_{DDA} + 0.1$	V	5
V_{REFL}	ADC reference voltage low	-0.1	0.1	V	
V_{ODPU}	Open drain pullup voltage level	V_{DD}	V_{DD}	V	6
$I_{INJPAD_DC_OP}$ ⁷	Continuous DC input current (positive / negative) that can be injected into an I/O pin	-3	+3	mA	
$I_{INJSUM_DC_OP}$	Continuous total DC input current that can be injected across all I/O pins such that there's no degradation in accuracy of analog modules: ADC and ACMP (See section Analog Modules)	—	30	mA	

1. Typical conditions assumes $V_{DD} = V_{DDA} = V_{REFH} = 5$ V, temperature = 25 °C and typical silicon process unless otherwise stated.
2. As V_{DD} varies between the minimum value and the absolute maximum value the analog characteristics of the I/O and the ADC will both change. See section [I/O parameters](#) and [ADC electrical specifications](#) respectively for details.
3. S32K148 will operate from 2.7 V when executing from internal FIRC. When the PLL is engaged S32K148 is guaranteed to operate from 2.97 V. All other S32K family devices operate from 2.7 V in all modes.
4. V_{DD} and V_{DDA} must be shorted to a common source on PCB. The differential voltage between V_{DD} and V_{DDA} is for RF-AC only. Appropriate decoupling capacitors to be used to filter noise on the supplies. See application note [AN5032](#) for reference supply design for SAR ADC.

	STOP2 → Asynchronous DMA Wakeup	1	1.1	1.3	μs
	Pin reset → Code execution	—	214	—	μs

NOTE

HSRUN should only be used when frequencies in excess of 80 MHz are required. When using 80 MHz and below, RUN mode is the recommended operating mode.

4.7 Power consumption

The following table shows the power consumption targets for the device in various mode of operations. Attached *S32K1xx_Power_Modes_Configuration.xlsx* details the modes used in gathering the power consumption data stated in the following table [Table 7](#). For full functionality refer to table: Module operation in available power modes of the *Reference Manual*.

5.3 DC electrical specifications at 3.3 V Range

NOTE

For details on the pad types defined in [Table 11](#) and [Table 12](#), see Reference Manual section *IO Signal Table* and IO Signal Description Input Multiplexing sheet(s) attached with Reference Manual.

R_{PD}	Internal pulldown resistors	20		60	$k\Omega$	9

1. S32K148 will operate from 2.7 V when executing from internal FIRC. When the PLL is engaged S32K148 is guaranteed to operate from 2.97 V. All other S32K family devices operate from 2.7 V in all modes.
2. For reset pads, same V_{ih} levels are applicable
3. For reset pads, same V_{il} levels are applicable
4. The value given is measured at high drive strength mode. For value at low drive strength mode see the $I_{oh_Standard}$ value given above.
5. For reference only. Run simulations with the IBIS model and custom board for accurate results.

I/O parameters

- Several I/O have both high drive and normal drive capability selected by the associated Portx_PCRn[DSE] control bit. All other GPIOs are normal drive only. For details see IO Signal Description Input Multiplexing sheet(s) attached with the *Reference Manual*.
- When using ENET and SAI on S32K148, the overall device limits associated with high drive pin configurations must be respected i.e. On 144-pin LQFP the general purpose pins: PTA10, PTD0, and PTE4 must be set to low drive.
- Measured at input $V = V_{SS}$
- Measured at input $V = V_{DD}$

5.4 DC electrical specifications at 5.0 V Range

Table 25. NVM reliability specifications (continued)

Symbol	Description	Min.	Typ.	Max.	Unit	Notes
When using FlexMemory feature : FlexRAM as Emulated EEPROM						
t_{nvmretee}	Data retention	5	—	—	years	4
$n_{\text{nvmwree16}}$	Write endurance	100 K	—	—	writes	5, 6, 7
$n_{\text{nvmwree256}}$	• EEPROM backup to FlexRAM ratio = 16 • EEPROM backup to FlexRAM ratio = 256	1.6 M	—	—	writes	

1. Data retention period per block begins upon initial user factory programming or after each subsequent erase.
2. Program and Erase for PFlash and DFlash are supported across product temperature specification in Normal Mode (not supported in HSRUN mode).
3. Cycling endurance is per DFlash or PFlash Sector.
4. Data retention period per block begins upon initial user factory programming or after each subsequent erase. Background maintenance operations during normal FlexRAM usage extend effective data retention life beyond 5 years.
5. FlexMemory write endurance specified for 16-bit and/or 32-bit writes to FlexRAM and is supported across product temperature specification in Normal Mode (not supported in HSRUN mode). Greater write endurance may be achieved with larger ratios of EEPROM backup to FlexRAM.
6. For usage of any EEE driver other than the FlexMemory feature, the endurance spec will fall back to the specified endurance value of the D-Flash specification (1K).
7. [FlexMemory calculator tool](#) is available at NXP web site for help in estimation of the maximum write endurance achievable at specific EEPROM/FlexRAM ratios. The “In Spec” portions of the online calculator refer to the NVM reliability specifications section of data sheet. This calculator is only applies to the FlexMemory feature.

6.3.2 QuadSPI AC specifications

The following table describes the QuadSPI electrical characteristics.

- Measurements are with maximum output load of 25 pF, input transition of 1 ns and pad configured with fastest slew settings (DSE = 1'b1).
- I/O operating voltage ranges from 2.97 V to 3.6 V
- While doing the mode transition (RUN -> HSRUN or HSRUN -> RUN), the interface should be OFF.
- Add 50 ohm series termination on board in QuadSPI SCK for Flash A to avoid loop back reflection when using in Internal DQS (PAD Loopback) mode.
- QuadSPI trace length should be 3 inches.
- For non-Quad mode of operation if external device doesn't have pull-up feature, external pull-up needs to be added at board level for non-used pads.
- With external pull-up, performance of the interface may degrade based on load associated with external pull-up.

5. For operating frequency ≤ 64 Mhz, Output invalid time is 5 ns.
6. Program register value QuadSPI_FLASHCR[TCSS] = 4'h2
7. Program register value QuadSPI_FLASHCR[TCSH] = 4'h1

Table 27. 12-bit ADC operating conditions (continued)

Symbol	Description	Conditions	Min.	Typ. ¹	Max.	Unit	Notes
f_{ADCK}	ADC conversion clock frequency	Normal usage	2	40	50	MHz	3, 4
f_{CONV}	ADC conversion frequency	No ADC hardware averaging. ⁵ Continuous conversions enabled, subsequent conversion time	46.4	928	1160	Ksps	6, 7
		ADC hardware averaging set to 32. ⁵ Continuous conversions enabled, subsequent conversion time	1.45	29	36.25	Ksps	6, 7

1. Typical values assume $V_{\text{DDA}} = 5 \text{ V}$, $\text{Temp} = 25 \text{ }^{\circ}\text{C}$, $f_{\text{ADCK}} = 40 \text{ MHz}$, $R_{\text{AS}} = 20 \text{ } \Omega$, and $C_{\text{AS}} = 10 \text{ nF}$ unless otherwise stated. Typical values are for reference only, and are not tested in production.
2. For packages without dedicated V_{REFH} and V_{REFL} pins, V_{REFH} is internally tied to V_{DDA} , and V_{REFL} is internally tied to V_{SS} . To get maximum performance, reference supply quality should be better than SAR ADC. See application note [AN5032](#) for details.
3. Clock and compare cycle need to be set according to the guidelines mentioned in the *Reference Manual*.
4. ADC conversion will become less reliable above maximum frequency.
5. When using ADC hardware averaging, see the *Reference Manual* to determine the most appropriate setting for AVGS.
6. Numbers based on the minimum sampling time of 275 ns.
7. For guidelines and examples of conversion rate calculation, see the *Reference Manual* section 'Calibration function'
