Understanding Embedded - CPLDs (Complex Programmable Logic Devices)

Embedded - CPLDs, or Complex Programmable Logic Devices, are highly versatile digital logic devices used in electronic systems. These programmable components are designed to perform complex logical operations and can be customized for specific applications. Unlike fixed-function ICs, CPLDs offer the flexibility to reprogram their configuration, making them an ideal choice for various embedded systems. They consist of a set of logic gates and programmable interconnects, allowing designers to implement complex logic circuits without needing custom hardware.

Applications of Embedded - CPLDs

Details	
Product Status	Obsolete
Programmable Type	In-System Reprogrammable™ (ISR™) CMOS
Delay Time tpd(1) Max	10 ns
Voltage Supply - Internal	4.75V ~ 5.25V
Number of Logic Elements/Blocks	-
Number of Macrocells	64
Number of Gates	-
Number of I/O	37
Operating Temperature	0°C ~ 70°C (TA)
Mounting Type	Surface Mount
Package / Case	44-LCC (J-Lead)
Supplier Device Package	44-PLCC (16.61x16.61)
Purchase URL	https://www.e-xfl.com/product-detail/infineon-technologies/cy37064p44-125jxct

Selection Guide

5.0V Selection Guide

General Information

Architecture Overview of Ultra37000 Family

Programmable Interconnect Matrix

The PIM consists of a completely global routing matrix for signals from I/O pins and feedbacks from the logic blocks. The PIM provides extremely robust interconnection to avoid fitting and density limitations.

The inputs to the PIM consist of all I/O and dedicated input pins and all macrocell feedbacks from within the logic blocks. The number of PIM inputs increases with pin count and the number of logic blocks. The outputs from the PIM are signals routed to the appropriate logic blocks. Each logic block receives 36 inputs from the PIM and their complements, allowing for 32-bit operations to be implemented in a single pass through the device. The wide number of inputs to the logic block also improves the routing capacity of the Ultra37000 family.

An important feature of the PIM is its simple timing. The propagation delay through the PIM is accounted for in the timing specifications for each device. There is no additional delay for traveling through the PIM. In fact, all inputs travel through the PIM. As a result, there are no route-dependent timing parameters on the Ultra37000 devices. The worst-case PIM delays are incorporated in all appropriate Ultra37000 specifications.

Routing signals through the PIM is completely invisible to the user. All routing is accomplished by software—no hand routing is necessary. *Warp*® and third-party development packages automatically route designs for the Ultra37000 family in a matter of minutes. Finally, the rich routing resources of the Ultra37000 family accommodate last minute logic changes while maintaining fixed pin assignments.

Logic Block

The logic block is the basic building block of the Ultra37000 architecture. It consists of a product term array, an intelligent product-term allocator, 16 macrocells, and a number of I/O cells. The number of I/O cells varies depending on the device used. Refer to *Figure 1* for the block diagram.

Product Term Array

Each logic block features a 72 x 87 programmable product term array. This array accepts 36 inputs from the PIM, which originate from macrocell feedbacks and device pins. Active LOW and active HIGH versions of each of these inputs are generated to create the full 72-input field. The 87 product terms in the array can be created from any of the 72 inputs.

Of the 87 product terms, 80 are for general-purpose use for the 16 macrocells in the logic block. Four of the remaining seven product terms in the logic block are output enable (OE) product terms. Each of the OE product terms controls up to eight of the 16 macrocells and is selectable on an individual macrocell basis. In other words, each I/O cell can select between one of two OE product terms to control the output buffer. The first two of these four OE product terms are available to the upper half of the I/O macrocells in a logic block. The other two OE product terms are available to the lower half of the I/O macrocells in a logic block.

The next two product terms in each logic block are dedicated asynchronous set and asynchronous reset product terms. The final product term is the product term clock. The set, reset, OE and product term clock have polarity control to realize OR functions in a single pass through the array.

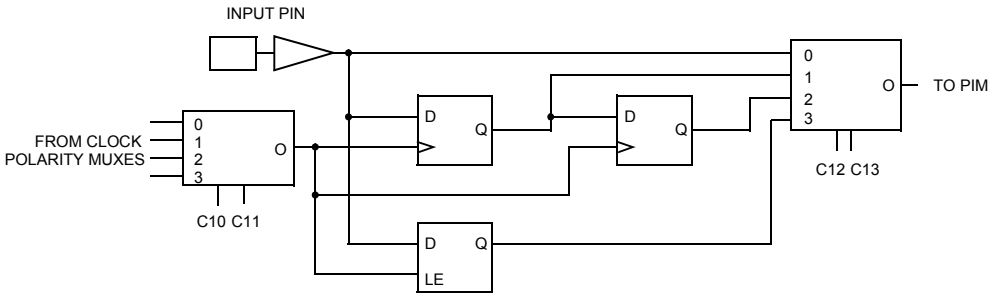

Figure 3. Input Macrocell

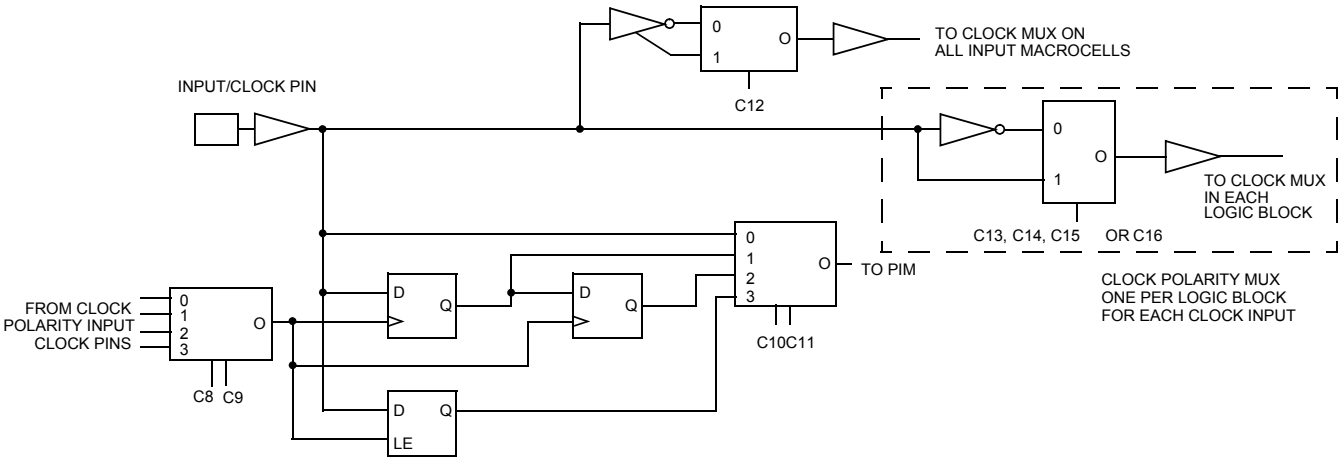

Figure 4. Input/Clock Macrocell

Clocking

Each I/O and buried macrocell has access to four synchronous clocks (CLK0, CLK1, CLK2 and CLK3) as well as an asynchronous product term clock PTCLK. Each input macrocell has access to all four synchronous clocks.

Dedicated Inputs/Clocks

Five pins on each member of the Ultra37000 family are designated as input-only. There are two types of dedicated inputs on Ultra37000 devices: input pins and input/clock pins. *Figure 3* illustrates the architecture for input pins. Four input options are available for the user: combinatorial, registered, double-registered, or latched. If a registered or latched option is selected, any one of the input clocks can be selected for control.

Figure 4 illustrates the architecture for the input/clock pins. Like the input pins, input/clock pins can be combinatorial, registered, double-registered, or latched. In addition, these pins feed the clocking structures throughout the device. The clock path at the input has user-configurable polarity.

Product Term Clocking

In addition to the four synchronous clocks, the Ultra37000 family also has a product term clock for asynchronous clocking. Each logic block has an independent product term clock which is available to all 16 macrocells. Each product term clock also supports user configurable polarity selection.

Timing Model

One of the most important features of the Ultra37000 family is the simplicity of its timing. All delays are worst case and system performance is unaffected by the features used. *Figure 5* illustrates the true timing model for the 167-MHz devices in high speed mode. For combinatorial paths, any input to any output incurs a 6.5-ns worst-case delay regardless of the amount of logic used. For synchronous systems, the input set-up time to the output macrocells for any input is 3.5 ns and the clock to output time is also 4.0 ns. These measurements are for any output and synchronous clock, regardless of the logic used.

The Ultra37000 features:

- No fanout delays
- No expander delays
- No dedicated vs. I/O pin delays
- No additional delay through PIM
- No penalty for using 0–16 product terms
- No added delay for steering product terms
- No added delay for sharing product terms
- No routing delays
- No output bypass delays

The simple timing model of the Ultra37000 family eliminates unexpected performance penalties.

The third programming option for Ultra37000 devices is to utilize the embedded controller or processor that already exists in the system. The Ultra37000 ISR software assists in this method by converting the device JEDEC maps into the ISR serial stream that contains the ISR instruction information and the addresses and data of locations to be programmed. The embedded controller then simply directs this ISR stream to the chain of Ultra37000 devices to complete the desired reconfiguring or diagnostic operations. Contact your local sales office for information on availability of this option.

The fourth method for programming Ultra37000 devices is to use the same programmer that is currently being used to program FLASH370i devices.

For all pinout, electrical, and timing requirements, refer to device data sheets. For ISR cable and software specifications, refer to the UltraISR kit data sheet (CY3700i).

Third-Party Programmers

As with development software, Cypress support is available on a wide variety of third-party programmers. All major third-party programmers (including BP Micro, Data I/O, and SMS) support the Ultra37000 family.

(d) Test Waveforms

Switching Characteristics Over the Operating Range [12]

Parameter	Description	Unit
Combinatorial Mode Parameters		
t_{PD}[13, 14, 15]	Input to Combinatorial Output	ns
t_{PDL}[13, 14, 15]	Input to Output Through Transparent Input or Output Latch	ns
t_{PDLL}[13, 14, 15]	Input to Output Through Transparent Input and Output Latches	ns
t_{EA}[13, 14, 15]	Input to Output Enable	ns
t_{ER}[11, 13]	Input to Output Disable	ns
Input Register Parameters		
t_{WL}	Clock or Latch Enable Input LOW Time[8]	ns
t_{WH}	Clock or Latch Enable Input HIGH Time[8]	ns
t_{IS}	Input Register or Latch Set-up Time	ns
t_{IH}	Input Register or Latch Hold Time	ns
t_{ICO}[13, 14, 15]	Input Register Clock or Latch Enable to Combinatorial Output	ns
t_{ICOL}[13, 14, 15]	Input Register Clock or Latch Enable to Output Through Transparent Output Latch	ns
Synchronous Clocking Parameters		
t_{CO}[14, 15]	Synchronous Clock (CLK_0, CLK_1, CLK_2, or CLK_3) or Latch Enable to Output	ns
t_S[13]	Set-Up Time from Input to Sync. Clk (CLK_0, CLK_1, CLK_2, or CLK_3) or Latch Enable	ns
t_H	Register or Latch Data Hold Time	ns
t_{CO2}[13, 14, 15]	Output Synchronous Clock (CLK_0, CLK_1, CLK_2, or CLK_3) or Latch Enable to Combinatorial Output Delay (Through Logic Array)	ns
t_{SCS}[13]	Output Synchronous Clock (CLK_0, CLK_1, CLK_2, or CLK_3) or Latch Enable to Output Synchronous Clock (CLK_0, CLK_1, CLK_2, or CLK_3) or Latch Enable (Through Logic Array)	ns
t_{SL}[13]	Set-Up Time from Input Through Transparent Latch to Output Register Synchronous Clock (CLK_0 CLK_1, CLK_2, or CLK_3) or Latch Enable	ns
t_{HL}	Hold Time for Input Through Transparent Latch from Output Register Synchronous Clock (CLK_0, CLK_1, CLK_2, or CLK_3) or Latch Enable	ns

Notes:
11. t_{ER} measured with 5-pF AC Test Load and t_{EA} measured with 35-pF AC Test Load.
12. All AC parameters are measured with two outputs switching and 35-pF AC Test Load.
13. Logic Blocks operating in Low-Power Mode, add t_{LP} to this spec.
14. Outputs using Slow Output Slew Rate, add t_{SLEW} to this spec.
15. When V_{CCO} = 3.3V, add $t_{3.3IO}$ to this spec.

Switching Characteristics Over the Operating Range (continued)[12]

Parameter	Description	Unit
Product Term Clocking Parameters		
t_{COPT}[13, 14, 15]	Product Term Clock or Latch Enable (PTCLK) to Output	ns
t_{SPT}	Set-Up Time from Input to Product Term Clock or Latch Enable (PTCLK)	ns
t_{HPT}	Register or Latch Data Hold Time	ns
t_{ISPT}[13]	Set-Up Time for Buried Register used as an Input Register from Input to Product Term Clock or Latch Enable (PTCLK)	ns
t_{IHPT}	Buried Register Used as an Input Register or Latch Data Hold Time	ns
t_{CO2PT}[13, 14, 15]	Product Term Clock or Latch Enable (PTCLK) to Output Delay (Through Logic Array)	ns
Pipelined Mode Parameters		
t_{ICS}[13]	Input Register Synchronous Clock (CLK_0, CLK_1, CLK_2, or CLK_3) to Output Register Synchronous Clock (CLK_0, CLK_1, CLK_2, or CLK_3)	ns
Operating Frequency Parameters		
f_{MAX1}	Maximum Frequency with Internal Feedback (Lesser of $1/t_{SCS}$, $1/(t_S + t_H)$, or $1/t_{CO}$)[5]	MHz
f_{MAX2}	Maximum Frequency Data Path in Output Registered/Latched Mode (Lesser of $1/(t_{WL} + t_{WH})$, $1/(t_S + t_H)$, or $1/t_{CO}$)[5]	MHz
f_{MAX3}	Maximum Frequency with External Feedback (Lesser of $1/(t_{CO} + t_S)$ or $1/(t_{WL} + t_{WH})$[5]	MHz
f_{MAX4}	Maximum Frequency in Pipelined Mode (Lesser of $1/(t_{CO} + t_{IS})$, $1/t_{ICS}$, $1/(t_{WL} + t_{WH})$, $1/(t_{IS} + t_{IH})$, or $1/t_{SCS}$)[5]	MHz
Reset/Preset Parameters		
t_{RW}	Asynchronous Reset Width[5]	ns
t_{RR}[13]	Asynchronous Reset Recovery Time[5]	ns
t_{RO}[13, 14, 15]	Asynchronous Reset to Output	ns
t_{PW}	Asynchronous Preset Width[5]	ns
t_{PR}[13]	Asynchronous Preset Recovery Time[5]	ns
t_{PO}[13, 14, 15]	Asynchronous Preset to Output	ns
User Option Parameters		
t_{LP}	Low Power Adder	ns
t_{SLEW}	Slow Output Slew Rate Adder	ns
$t_{3.3IO}$	3.3V I/O Mode Timing Adder[5]	ns
JTAG Timing Parameters		
$t_{S\ JTAG}$	Set-up Time from TDI and TMS to TCK[5]	ns
$t_{H\ JTAG}$	Hold Time on TDI and TMS[5]	ns
$t_{CO\ JTAG}$	Falling Edge of TCK to TDO[5]	ns
f_{JTAG}	Maximum JTAG Tap Controller Frequency[5]	ns
