Understanding [Embedded - CPLDs \(Complex Programmable Logic Devices\)](#)

Embedded - CPLDs, or Complex Programmable Logic Devices, are highly versatile digital logic devices used in electronic systems. These programmable components are designed to perform complex logical operations and can be customized for specific applications. Unlike fixed-function ICs, CPLDs offer the flexibility to reprogram their configuration, making them an ideal choice for various embedded systems. They consist of a set of logic gates and programmable interconnects, allowing designers to implement complex logic circuits without needing custom hardware.

Applications of Embedded - CPLDs

Details

Product Status	Obsolete
Programmable Type	In-System Reprogrammable™ (ISR™) CMOS
Delay Time tpd(1) Max	10 ns
Voltage Supply - Internal	3V ~ 3.6V
Number of Logic Elements/Blocks	-
Number of Macrocells	128
Number of Gates	-
Number of I/O	133
Operating Temperature	0°C ~ 70°C (TA)
Mounting Type	Surface Mount
Package / Case	160-LQFP
Supplier Device Package	160-TQFP (24x24)
Purchase URL	https://www.e-xfl.com/product-detail/infineon-technologies/cy37128vp160-125axc

The buried macrocell also supports input register capability. The buried macrocell can be configured to act as an input register (D-type or latch) whose input comes from the I/O pin associated with the neighboring macrocell. The output of all buried macrocells is sent directly to the PIM regardless of its configuration.

I/O Macrocell

Figure 2 illustrates the architecture of the I/O macrocell. The I/O macrocell supports the same functions as the buried macrocell with the addition of I/O capability. At the output of the macrocell, a polarity control mux is available to select active LOW or active HIGH signals. This has the added advantage of allowing significant logic reduction to occur in many applications.

The Ultra37000 macrocell features a feedback path to the PIM separate from the I/O pin input path. This means that if the macrocell is buried (fed back internally only), the associated I/O pin can still be used as an input.

Bus Hold Capabilities on all I/Os

Bus-hold, which is an improved version of the popular internal pull-up resistor, is a weak latch connected to the pin that does not degrade the device's performance. As a latch, bus-hold maintains the last state of a pin when the pin is placed in a high-impedance state, thus reducing system noise in bus-interface applications. Bus-hold additionally allows unused device pins to remain unconnected on the board, which is particularly useful during prototyping as designers can route new signals to the device without cutting trace connections to V_{CC} or GND. For more information, see the application note *Understanding Bus-Hold—A Feature of Cypress CPLDs*.

Programmable Slew Rate Control

Each output has a programmable configuration bit, which sets the output slew rate to fast or slow. For designs concerned with meeting FCC emissions standards the slow edge provides for lower system noise. For designs requiring very high performance the fast edge rate provides maximum system performance.

Figure 2. I/O and Buried Macrocells

Figure 3. Input Macrocell

Figure 4. Input/Clock Macrocell

Clocking

Each I/O and buried macrocell has access to four synchronous clocks (CLK0, CLK1, CLK2 and CLK3) as well as an asynchronous product term clock PTCLK. Each input macrocell has access to all four synchronous clocks.

Dedicated Inputs/Clocks

Five pins on each member of the Ultra37000 family are designated as input-only. There are two types of dedicated inputs on Ultra37000 devices: input pins and input/clock pins. *Figure 3* illustrates the architecture for input pins. Four input options are available for the user: combinatorial, registered, double-registered, or latched. If a registered or latched option is selected, any one of the input clocks can be selected for control.

Figure 4 illustrates the architecture for the input/clock pins. Like the input pins, input/clock pins can be combinatorial, registered, double-registered, or latched. In addition, these pins feed the clocking structures throughout the device. The clock path at the input has user-configurable polarity.

Product Term Clocking

In addition to the four synchronous clocks, the Ultra37000 family also has a product term clock for asynchronous clocking. Each logic block has an independent product term clock which is available to all 16 macrocells. Each product term clock also supports user configurable polarity selection.

Timing Model

One of the most important features of the Ultra37000 family is the simplicity of its timing. All delays are worst case and system performance is unaffected by the features used. *Figure 5* illustrates the true timing model for the 167-MHz devices in high speed mode. For combinatorial paths, any input to any output incurs a 6.5-ns worst-case delay regardless of the amount of logic used. For synchronous systems, the input set-up time to the output macrocells for any input is 3.5 ns and the clock to output time is also 4.0 ns. These measurements are for any output and synchronous clock, regardless of the logic used.

The Ultra37000 features:

- No fanout delays
- No expander delays
- No dedicated vs. I/O pin delays
- No additional delay through PIM
- No penalty for using 0–16 product terms
- No added delay for steering product terms
- No added delay for sharing product terms
- No routing delays
- No output bypass delays

The simple timing model of the Ultra37000 family eliminates unexpected performance penalties.

Figure 5. Timing Model for CY37128

JTAG and PCI Standards

PCI Compliance

5V operation of the Ultra37000 is fully compliant with the PCI Local Bus Specification published by the PCI Special Interest Group. The 3.3V products meet all PCI requirements except for the output 3.3V clamp, which is in direct conflict with 5V tolerance. The Ultra37000 family's simple and predictable timing model ensures compliance with the PCI AC specifications independent of the design.

IEEE 1149.1-compliant JTAG

The Ultra37000 family has an IEEE 1149.1 JTAG interface for both Boundary Scan and ISR.

Boundary Scan

The Ultra37000 family supports Bypass, Sample/Preload, Extest, Idcode, and Usercode boundary scan instructions. The JTAG interface is shown in Figure 6.

Figure 6. JTAG Interface

In-System Reprogramming (ISR)

In-System Reprogramming is the combination of the capability to program or reprogram a device on-board, and the ability to support design changes without changing the system timing or device pinout. This combination means design changes during debug or field upgrades do not cause board respins. The Ultra37000 family implements ISR by providing a JTAG compliant interface for on-board programming, robust routing

resources for pinout flexibility, and a simple timing model for consistent system performance.

Development Software Support

Warp

Warp is a state-of-the-art compiler and complete CPLD design tool. For design entry, Warp provides an IEEE-STD-1076/1164 VHDL text editor, an IEEE-STD-1364 Verilog text editor, and a graphical finite state machine editor. It provides optimized synthesis and fitting by replacing basic circuits with ones pre-optimized for the target device, by implementing logic in unused memory and by perfect communication between fitting and synthesis. To facilitate design and debugging, Warp provides graphical timing simulation and analysis.

Warp Professional™

Warp Professional contains several additional features. It provides an extra method of design entry with its graphical block diagram editor. It allows up to 5 ms timing simulation instead of only 2 ms. It allows comparison of waveforms before and after design changes.

Warp Enterprise™

Warp Enterprise provides even more features. It provides unlimited timing simulation and source-level behavioral simulation as well as a debugger. It has the ability to generate graphical HDL blocks from HDL text. It can even generate testbenches.

Warp is available for PC and UNIX platforms. Some features are not available in the UNIX version. For further information see the Warp for PC, Warp for UNIX, Warp Professional and Warp Enterprise data sheets on Cypress's web site (www.cypress.com).

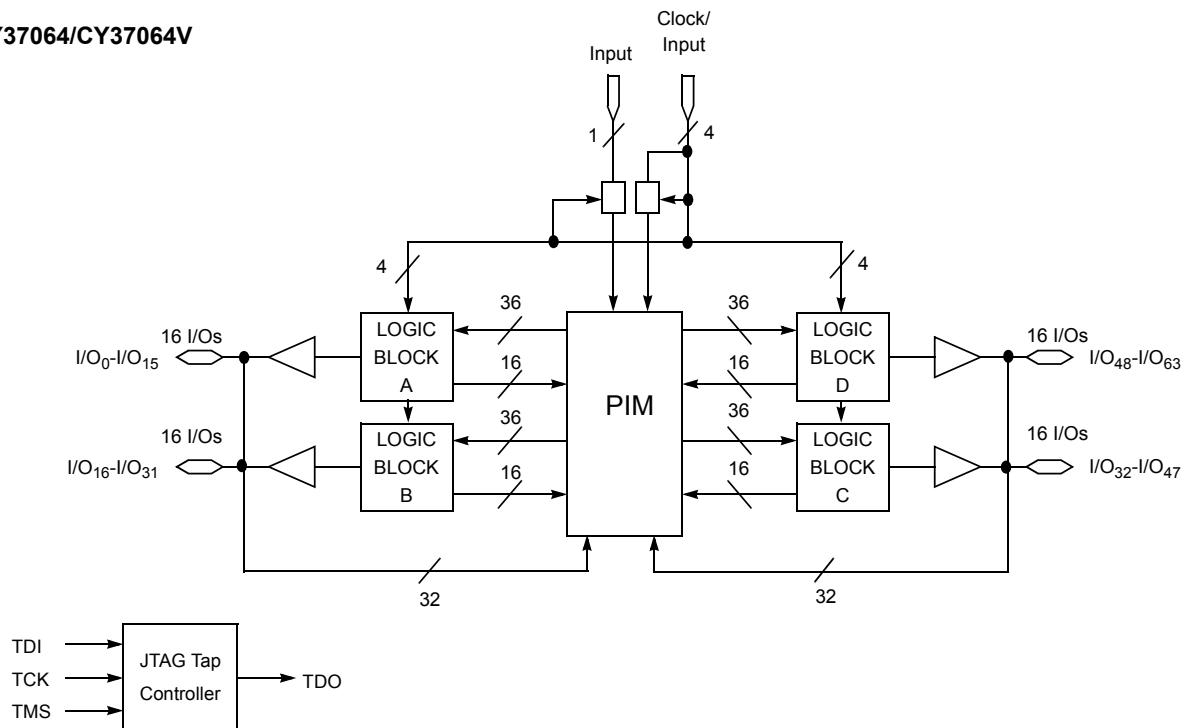

Third-Party Software

Although Warp is a complete CPLD development tool on its own, it interfaces with nearly every third party EDA tool. All major third-party software vendors provide support for the Ultra37000 family of devices. Refer to the third-party software data sheet or contact your local sales office for a list of currently supported third-party vendors.

Programming

There are four programming options available for Ultra37000 devices. The first method is to use a PC with the 37000 UltraISR programming cable and software. With this method, the ISR pins of the Ultra37000 devices are routed to a connector at the edge of the printed circuit board. The 37000 UltraISR programming cable is then connected between the parallel port of the PC and this connector. A simple configuration file instructs the ISR software of the programming operations to be performed on each of the Ultra37000 devices in the system. The ISR software then automatically completes all of the necessary data manipulations required to accomplish the programming, reading, verifying, and other ISR functions. For more information on the Cypress ISR Interface, see the ISR Programming Kit data sheet (CY3700i).

The second method for programming Ultra37000 devices is on automatic test equipment (ATE). This is accomplished through a file created by the ISR software. Check the Cypress website for the latest ISR software download information.

Document History Page

Document Title: Ultra37000 CPLD Family 5V, 3.3V, ISR™ High-Performance CPLDs Document Number: 38-03007				
REV.	ECN NO.	Issue Date	Orig. of Change	Description of Change
**	106272	04/18/01	SZV	Change from Spec number: 38-00475 to 38-03007
*A	124942	03/21/03	OOR	Updated 3.3V V _{CC} requirements for –144 speeds Added an Addendum
*B	126262	05/09/03	TEH	Changed pinout for CY37128V BB100 package
*C	128125	07/16/03	HOM	Obsoleted following 3.3V PLCC packaged devices: CY37032VP44-143JC CY37032VP44-100JC CY37032VP44-100JI CY37064VP44-143JC CY37064VP84-143JC CY37064VP44-100JC CY37064VP84-100JC CY37064VP44-100JI CY37064VP84-100JI CY37128VP84-125JC CY37128VP84-83JC CY37128VP84-83JI
*D	282709	See ECN	YDT	Changed package diagrams and labels for consistency Added Lead (Pb)-free logo on first page, as well as a note in Features Added Lead (Pb)-free package diagram labels Added Lead-free Parts to Ordering Information CY37032P44-200AXC, CY37032P44-200JXC, CY37032P44-154AXI, CY37032P44-154JXI, CY37032P44-125AXC, CY37032P44-125JXC, CY37064P44-200AXC, CY37064P44-200JXC, CY37064P100-200AXC, CY37064P44-154AXI, CY37064P44-154JXI, CY37064P44-125AXC, CY37064P44-125JXC, CY37064P100-125AXC, CY37064P44-125AXI, CY37064P100-125AXI, CY37128P84-167JXC, CY37128P100-167AXC, CY37128P160-167AXC, CY37128P84-125JXC, CY37128P100-125AXC, CY37128P160-125AXC, CY37128P84-125JXI, CY37128P100-125AXI, CY37128P160-125AXI, CY37128P84-100JXC, CY37128P100-100AXC, CY37128P160-100AXC, CY37128P100-100AXI, CY37192P160-154AXC, CY37192P160-125AXC, CY37192P160-125AXI, CY37192P160-83AXC, CY37192P160-83AXI, CY37256P160-154AXC, CY37256P160-125AXC, CY37256P160-125AXI, CY37256P160-83AXC, CY37256P160-83AXI, CY37032VP44-143AXC, CY37032VP44-100AXC, CY37032VP44-100AXI, CY37032VP44-100JXI, CY37064VP44-143AXC, CY37064VP100-143AXC, CY37064VP44-100AXC, CY37064VP100-100AXC, CY37064VP44-100AXI, CY37064VP100-100AXI, CY37128VP100-125AXC, CY37128VP160-125AXC, CY37128VP160-125AXI, CY37128VP100-83AXC, CY37128VP160-83AXC, CY37128VP100-83AXI, CY37128VP160-83AXI, CY37192VP160-100AXC, CY37192VP160-66AXC, CY37256VP160-100AXC, CY37256VP160-100AXI, CY37256VP160-66AXC
*E	321635	See ECN	PCX	Added Package Diagram BG292 Updated all PBGA package type information (BG292 & BG388)
