Welcome to E-XFL.COM

Understanding Embedded - CPLDs (Complex Programmable Logic Devices)

Embedded - CPLDs, or Complex Programmable Logic Devices, are highly versatile digital logic devices used in electronic systems. These programmable components are designed to perform complex logical operations and can be customized for specific applications. Unlike fixed-function ICs, CPLDs offer the flexibility to reprogram their configuration, making them an ideal choice for various embedded systems. They consist of a set of logic gates and programmable interconnects, allowing designers to implement complex logic circuits without needing custom hardware.

Applications of Embedded - CPLDs

Details	
Product Status	Obsolete
Programmable Type	In-System Reprogrammable™ (ISR™) CMOS
Delay Time tpd(1) Max	15 ns
Voltage Supply - Internal	4.75V ~ 5.25V
Number of Logic Elements/Blocks	-
Number of Macrocells	512
Number of Gates	-
Number of I/O	197
Operating Temperature	0°C ~ 70°C (TA)
Mounting Type	Surface Mount
Package / Case	292-BGA
Supplier Device Package	292-PBGA (27x27)
Purchase URL	https://www.e-xfl.com/product-detail/infineon-technologies/cy37512p256-83bgc

The buried macrocell also supports input register capability. The buried macrocell can be configured to act as an input register (D-type or latch) whose input comes from the I/O pin associated with the neighboring macrocell. The output of all buried macrocells is sent directly to the PIM regardless of its configuration.

I/O Macrocell

Figure 2 illustrates the architecture of the I/O macrocell. The I/O macrocell supports the same functions as the buried macrocell with the addition of I/O capability. At the output of the macrocell, a polarity control mux is available to select active LOW or active HIGH signals. This has the added advantage of allowing significant logic reduction to occur in many applications.

The Ultra37000 macrocell features a feedback path to the PIM separate from the I/O pin input path. This means that if the macrocell is buried (fed back internally only), the associated I/O pin can still be used as an input.

Bus Hold Capabilities on all I/Os

Bus-hold, which is an improved version of the popular internal pull-up resistor, is a weak latch connected to the pin that does not degrade the device's performance. As a latch, bus-hold maintains the last state of a pin when the pin is placed in a high-impedance state, thus reducing system noise in bus-interface applications. Bus-hold additionally allows unused device pins to remain unconnected on the board, which is particularly useful during prototyping as designers can route new signals to the device without cutting trace connections to V_{CC} or GND. For more information, see the application note *Understanding Bus-Hold—A Feature of Cypress CPLDs*.

Programmable Slew Rate Control

Each output has a programmable configuration bit, which sets the output slew rate to fast or slow. For designs concerned with meeting FCC emissions standards the slow edge provides for lower system noise. For designs requiring very high performance the fast edge rate provides maximum system performance.

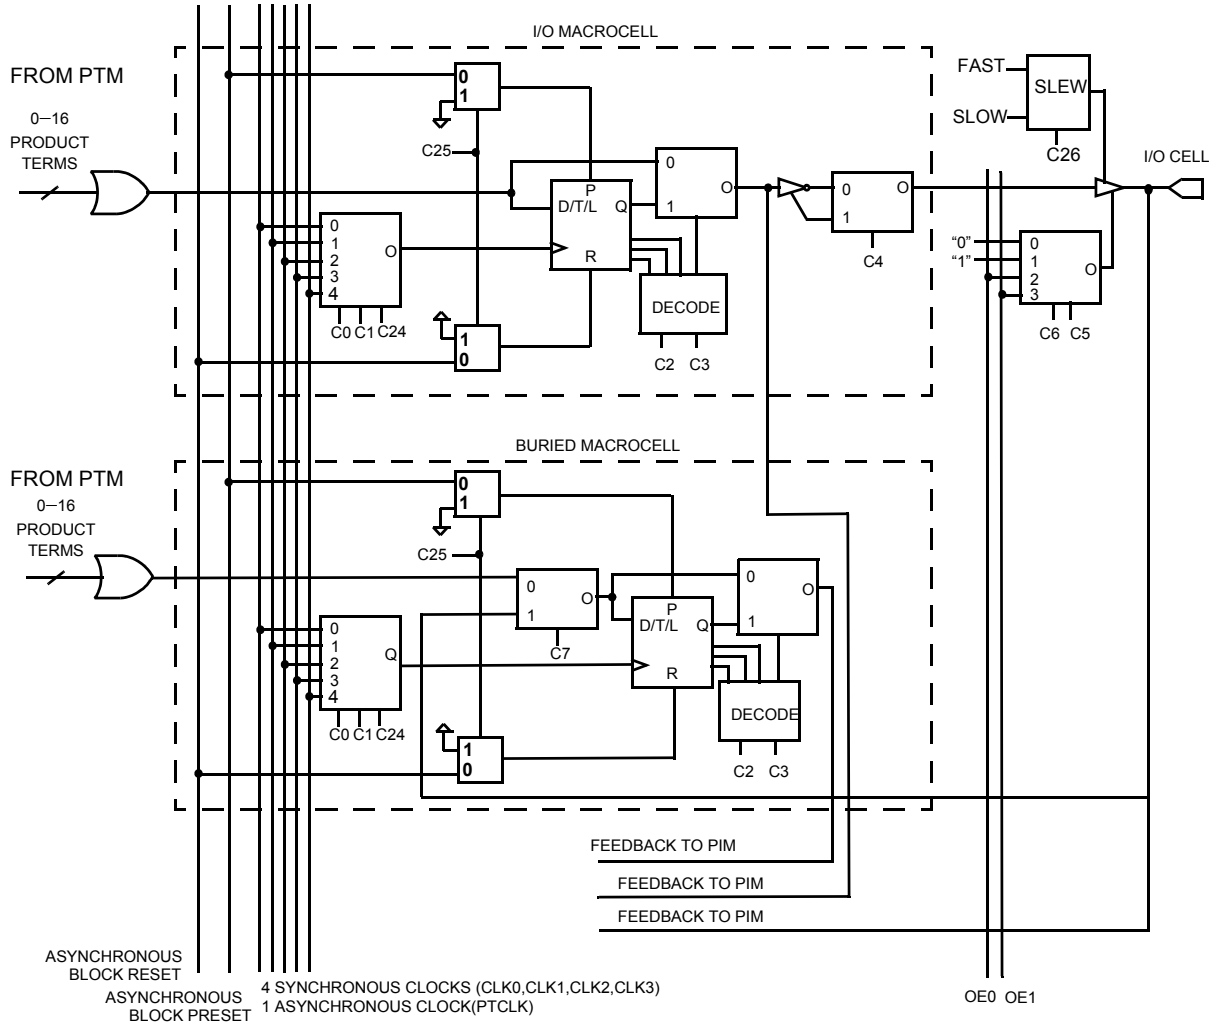

Figure 2. I/O and Buried Macrocells

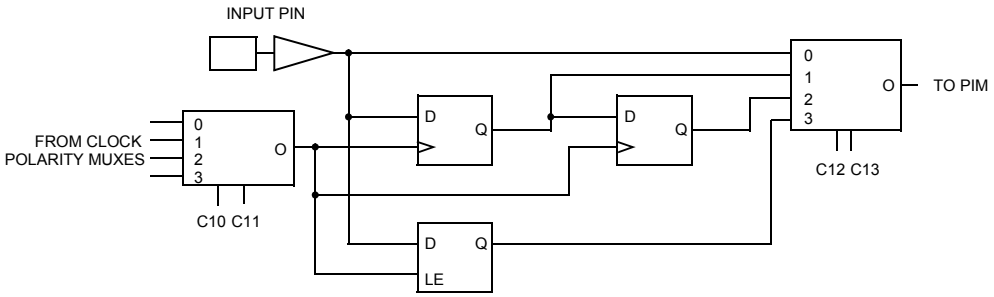

Figure 3. Input Macrocell

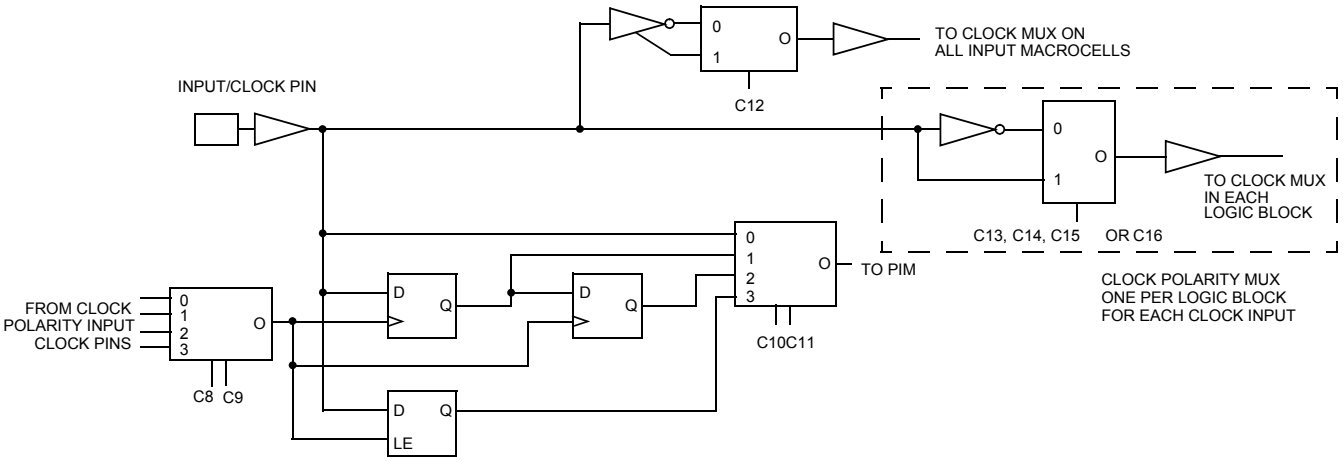

Figure 4. Input/Clock Macrocell

Clocking

Each I/O and buried macrocell has access to four synchronous clocks (CLK0, CLK1, CLK2 and CLK3) as well as an asynchronous product term clock PTCLK. Each input macrocell has access to all four synchronous clocks.

Dedicated Inputs/Clocks

Five pins on each member of the Ultra37000 family are designated as input-only. There are two types of dedicated inputs on Ultra37000 devices: input pins and input/clock pins. *Figure 3* illustrates the architecture for input pins. Four input options are available for the user: combinatorial, registered, double-registered, or latched. If a registered or latched option is selected, any one of the input clocks can be selected for control.

Figure 4 illustrates the architecture for the input/clock pins. Like the input pins, input/clock pins can be combinatorial, registered, double-registered, or latched. In addition, these pins feed the clocking structures throughout the device. The clock path at the input has user-configurable polarity.

Product Term Clocking

In addition to the four synchronous clocks, the Ultra37000 family also has a product term clock for asynchronous clocking. Each logic block has an independent product term clock which is available to all 16 macrocells. Each product term clock also supports user configurable polarity selection.

Timing Model

One of the most important features of the Ultra37000 family is the simplicity of its timing. All delays are worst case and system performance is unaffected by the features used. *Figure 5* illustrates the true timing model for the 167-MHz devices in high speed mode. For combinatorial paths, any input to any output incurs a 6.5-ns worst-case delay regardless of the amount of logic used. For synchronous systems, the input set-up time to the output macrocells for any input is 3.5 ns and the clock to output time is also 4.0 ns. These measurements are for any output and synchronous clock, regardless of the logic used.

The Ultra37000 features:

- No fanout delays
- No expander delays
- No dedicated vs. I/O pin delays
- No additional delay through PIM
- No penalty for using 0–16 product terms
- No added delay for steering product terms
- No added delay for sharing product terms
- No routing delays
- No output bypass delays

The simple timing model of the Ultra37000 family eliminates unexpected performance penalties.

Switching Characteristics Over the Operating Range [12]

Parameter	Description	Unit
Combinatorial Mode Parameters		
t_{PD}[13, 14, 15]	Input to Combinatorial Output	ns
t_{PDL}[13, 14, 15]	Input to Output Through Transparent Input or Output Latch	ns
t_{PDLL}[13, 14, 15]	Input to Output Through Transparent Input and Output Latches	ns
t_{EA}[13, 14, 15]	Input to Output Enable	ns
t_{ER}[11, 13]	Input to Output Disable	ns
Input Register Parameters		
t_{WL}	Clock or Latch Enable Input LOW Time[8]	ns
t_{WH}	Clock or Latch Enable Input HIGH Time[8]	ns
t_{IS}	Input Register or Latch Set-up Time	ns
t_{IH}	Input Register or Latch Hold Time	ns
t_{ICO}[13, 14, 15]	Input Register Clock or Latch Enable to Combinatorial Output	ns
t_{ICOL}[13, 14, 15]	Input Register Clock or Latch Enable to Output Through Transparent Output Latch	ns
Synchronous Clocking Parameters		
t_{CO}[14, 15]	Synchronous Clock (CLK_0, CLK_1, CLK_2, or CLK_3) or Latch Enable to Output	ns
t_S[13]	Set-Up Time from Input to Sync. Clk (CLK_0, CLK_1, CLK_2, or CLK_3) or Latch Enable	ns
t_H	Register or Latch Data Hold Time	ns
t_{CO2}[13, 14, 15]	Output Synchronous Clock (CLK_0, CLK_1, CLK_2, or CLK_3) or Latch Enable to Combinatorial Output Delay (Through Logic Array)	ns
t_{SCS}[13]	Output Synchronous Clock (CLK_0, CLK_1, CLK_2, or CLK_3) or Latch Enable to Output Synchronous Clock (CLK_0, CLK_1, CLK_2, or CLK_3) or Latch Enable (Through Logic Array)	ns
t_{SL}[13]	Set-Up Time from Input Through Transparent Latch to Output Register Synchronous Clock (CLK_0 CLK_1, CLK_2, or CLK_3) or Latch Enable	ns
t_{HL}	Hold Time for Input Through Transparent Latch from Output Register Synchronous Clock (CLK_0, CLK_1, CLK_2, or CLK_3) or Latch Enable	ns

Notes:
11. t_{ER} measured with 5-pF AC Test Load and t_{EA} measured with 35-pF AC Test Load.
12. All AC parameters are measured with two outputs switching and 35-pF AC Test Load.
13. Logic Blocks operating in Low-Power Mode, add t_{LP} to this spec.
14. Outputs using Slow Output Slew Rate, add t_{SLEW} to this spec.
15. When V_{CCO} = 3.3V, add $t_{3.3IO}$ to this spec.

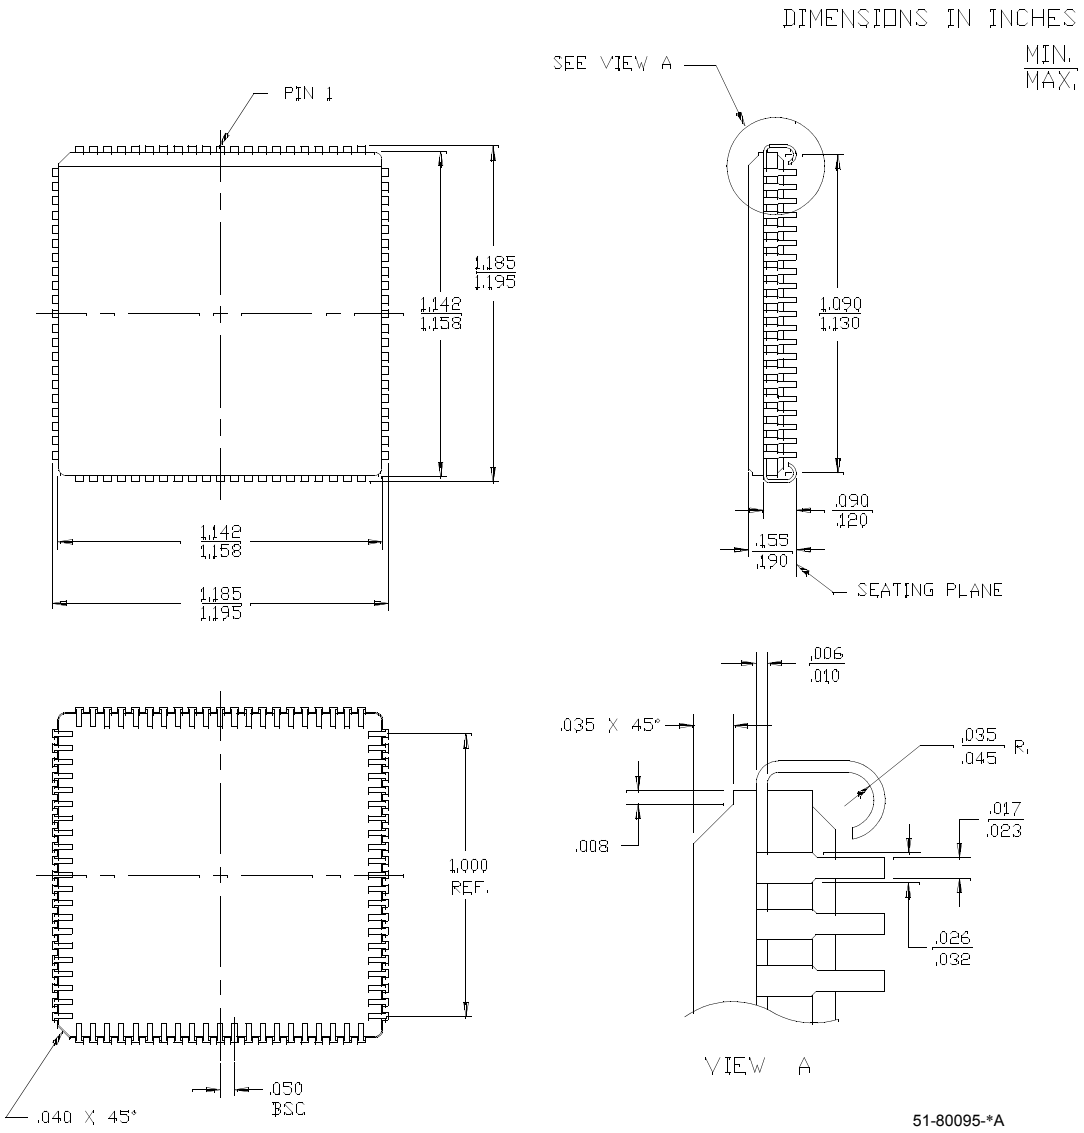
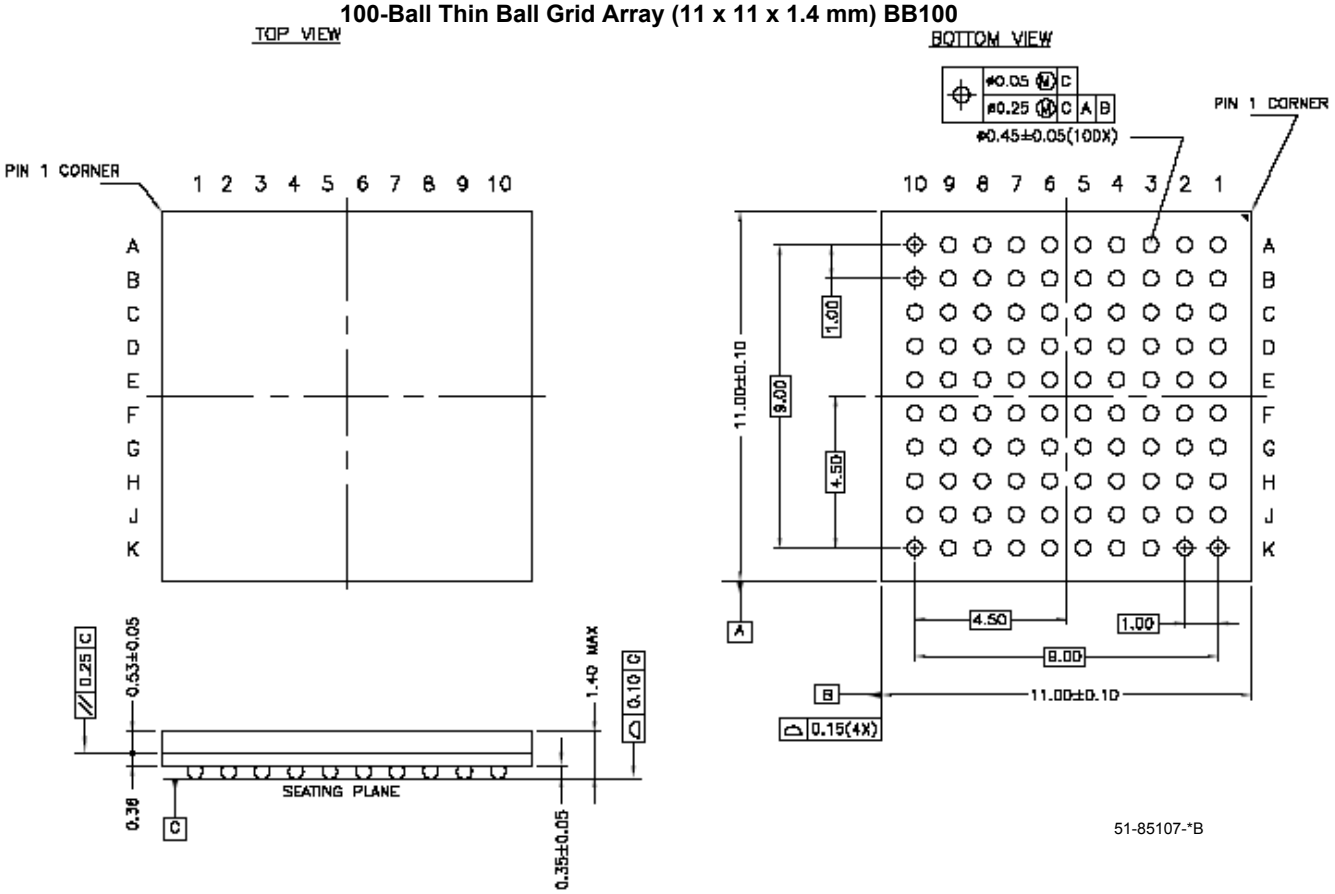
Package Diagrams (continued)

84-Lead Ceramic Leaded Chip Carrier Y84



Package Diagrams (continued)

100-Ball Thin Ball Grid Array (11 x 11 x 1.4 mm) BB100



Package Diagrams (continued)

160-Lead Lead (Pb)-Free Thin Plastic Quad Flat Pack (24 x 24 x 1.4 mm) (TQFP) A160
