### What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

- Notes**
- Value of current at which the device operation is guaranteed even if the current flows from an output pin to the  $EV_{SS0}$ ,  $EV_{SS1}$  and  $V_{SS}$  pin.
  - Do not exceed the total current value.
  - Specification under conditions where the duty factor  $\leq 70\%$ .  
The output current value that has changed to the duty factor  $> 70\%$  the duty ratio can be calculated with the following expression (when changing the duty factor from 70% to n%).
    - Total output current of pins =  $(I_{OL} \times 0.7)/(n \times 0.01)$   
 $\text{<Example> Where } n = 80\% \text{ and } I_{OL} = 10.0\text{ mA}$   
 Total output current of pins =  $(10.0 \times 0.7)/(80 \times 0.01) \cong 8.7\text{ mA}$   
 However, the current that is allowed to flow into one pin does not vary depending on the duty factor.  
 A current higher than the absolute maximum rating must not flow into one pin.

**Remark** Unless specified otherwise, the characteristics of alternate-function pins are the same as those of the port pins.

5. The smaller maximum transfer rate derived by using  $f_{MCK}/12$  or the following expression is the valid maximum transfer rate.

Expression for calculating the transfer rate when  $2.4\text{ V} \leq EV_{DD0} < 3.3\text{ V}$  and  $1.6\text{ V} \leq V_b \leq 2.0\text{ V}$

$$\text{Maximum transfer rate} = \frac{1}{\{-C_b \times R_b \times \ln(1 - \frac{1.5}{V_b})\} \times 3} \text{ [bps]}$$

$$\text{Baud rate error (theoretical value)} = \frac{\frac{1}{\text{Transfer rate} \times 2} - \{-C_b \times R_b \times \ln(1 - \frac{1.5}{V_b})\}}{(\frac{1}{\text{Transfer rate}}) \times \text{Number of transferred bits}} \times 100 \text{ [%]}$$

\* This value is the theoretical value of the relative difference between the transmission and reception sides.

6. This value as an example is calculated when the conditions described in the “Conditions” column are met. Refer to Note 5 above to calculate the maximum transfer rate under conditions of the customer.

**Caution** Select the TTL input buffer for the RxDq pin and the N-ch open drain output ( $V_{DD}$  tolerance (for the 20- to 52-pin products)/ $EV_{DD}$  tolerance (for the 64- to 100-pin products)) mode for the TxDq pin by using port input mode register g (PIMg) and port output mode register g (POMg).
