What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Remark For pin identification, see **1.4 Pin Identification**.

- 100-pin plastic LQFP (14 × 20 mm, 0.65 mm pitch)

Cautions 1. Make EV_{SS0}, EV_{SS1} pins the same potential as V_{SS} pin.

2. Make V_{DD} pin the potential that is higher than EV_{DD0}, EV_{DD1} pins (EV_{DD0} = EV_{DD1}).
3. Connect the REGC pin to V_{SS} via a capacitor (0.47 to 1 μ F).

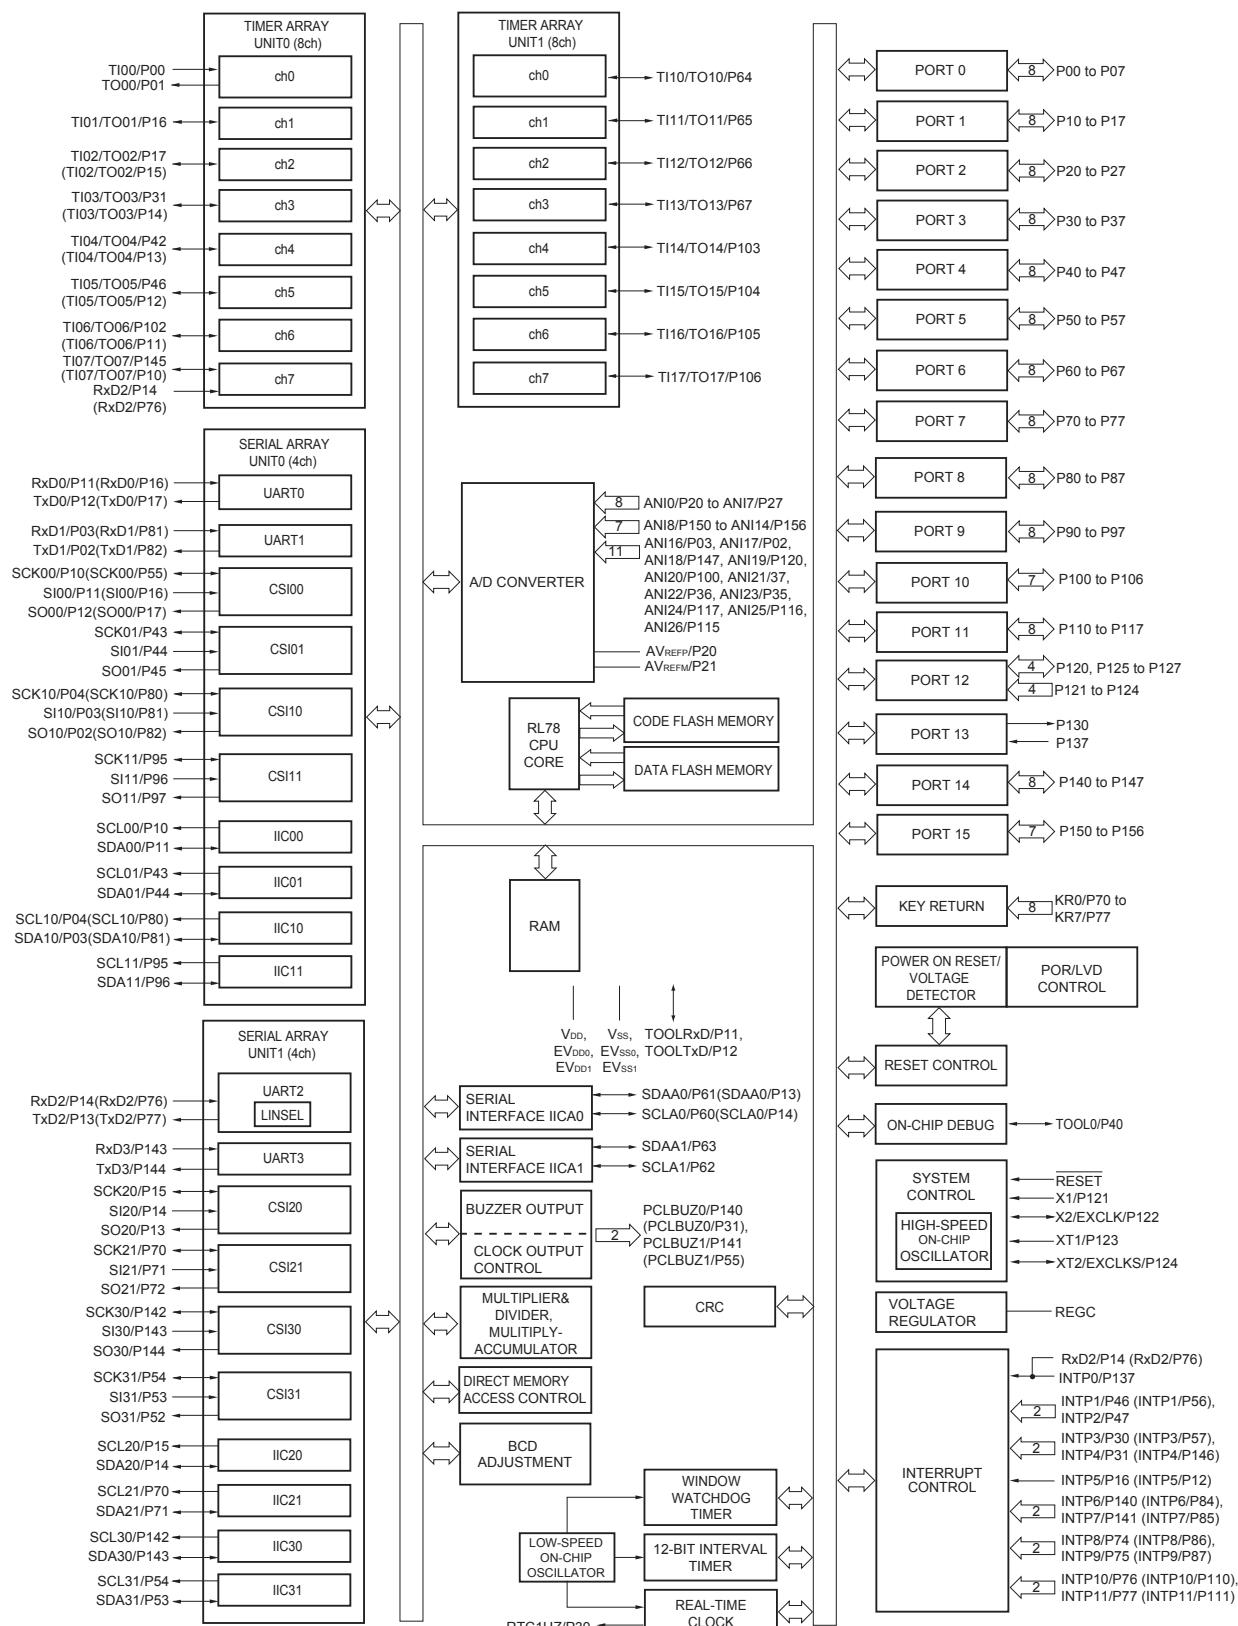

Remarks 1. For pin identification, see **1.4 Pin Identification**.

2. When using the microcontroller for an application where the noise generated inside the microcontroller must be reduced, it is recommended to supply separate powers to the V_{DD}, EV_{DD0} and EV_{DD1} pins and connect the V_{SS}, EV_{SS0} and EV_{SS1} pins to separate ground lines.
3. Functions in parentheses in the above figure can be assigned via settings in the peripheral I/O redirection register (PIOR). Refer to **Figure 4-8 Format of Peripheral I/O Redirection Register (PIOR)** in the RL78/G13 User's Manual.

2. ELECTRICAL SPECIFICATIONS ($T_A = -40$ to $+85^\circ\text{C}$)

This chapter describes the following electrical specifications.

Target products A: Consumer applications $T_A = -40$ to $+85^\circ\text{C}$

R5F100xxAxx, R5F101xxAxx

D: Industrial applications $T_A = -40$ to $+85^\circ\text{C}$

R5F100xxDxx, R5F101xxDxx

G: Industrial applications when $T_A = -40$ to $+105^\circ\text{C}$ products is used in the range of $T_A = -40$ to $+85^\circ\text{C}$

R5F100xxGxx

- Cautions**
1. The RL78 microcontrollers have an on-chip debug function, which is provided for development and evaluation. Do not use the on-chip debug function in products designated for mass production, because the guaranteed number of rewritable times of the flash memory may be exceeded when this function is used, and product reliability therefore cannot be guaranteed. Renesas Electronics is not liable for problems occurring when the on-chip debug function is used.
 2. With products not provided with an $\text{EV}_{\text{DD}0}$, $\text{EV}_{\text{DD}1}$, $\text{EV}_{\text{SS}0}$, or $\text{EV}_{\text{SS}1}$ pin, replace $\text{EV}_{\text{DD}0}$ and $\text{EV}_{\text{DD}1}$ with V_{DD} , or replace $\text{EV}_{\text{SS}0}$ and $\text{EV}_{\text{SS}1}$ with V_{SS} .
 3. The pins mounted depend on the product. Refer to 2.1 Port Function to 2.2.1 Functions for each product.

Notes 1. Total current flowing into V_{DD} , EV_{DD0} , and EV_{DD1} , including the input leakage current flowing when the level of the input pin is fixed to V_{DD} , EV_{DD0} , and EV_{DD1} , or V_{SS} , EV_{SS0} , and EV_{SS1} . The values below the MAX. column include the peripheral operation current. However, not including the current flowing into the A/D converter, LVD circuit, I/O port, and on-chip pull-up/pull-down resistors and the current flowing during data flash rewrite.

2. When high-speed on-chip oscillator and subsystem clock are stopped.
3. When high-speed system clock and subsystem clock are stopped.
4. When high-speed on-chip oscillator and high-speed system clock are stopped. When $AMPHS1 = 1$ (Ultra-low power consumption oscillation). However, not including the current flowing into the RTC, 12-bit interval timer, and watchdog timer.
5. Relationship between operation voltage width, operation frequency of CPU and operation mode is as below.

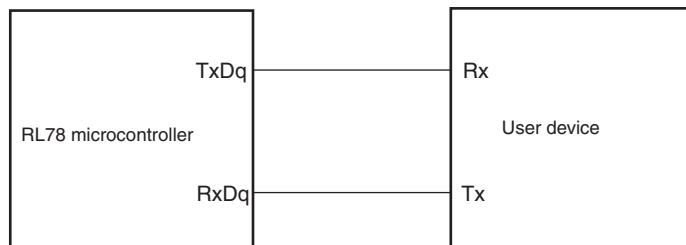

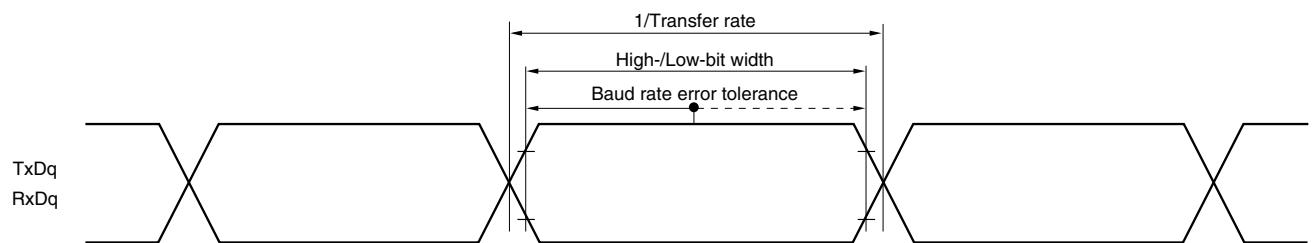

HS (high-speed main) mode: $2.7 \text{ V} \leq V_{DD} \leq 5.5 \text{ V}$ @ 1 MHz to 32 MHz

$2.4 \text{ V} \leq V_{DD} \leq 5.5 \text{ V}$ @ 1 MHz to 16 MHz

LS (low-speed main) mode: $1.8 \text{ V} \leq V_{DD} \leq 5.5 \text{ V}$ @ 1 MHz to 8 MHz

LV (low-voltage main) mode: $1.6 \text{ V} \leq V_{DD} \leq 5.5 \text{ V}$ @ 1 MHz to 4 MHz

- Remarks**
1. f_{MX} : High-speed system clock frequency (X1 clock oscillation frequency or external main system clock frequency)
 2. f_{IH} : High-speed on-chip oscillator clock frequency
 3. f_{SUB} : Subsystem clock frequency (XT1 clock oscillation frequency)
 4. Except subsystem clock operation, temperature condition of the TYP. value is $T_A = 25^\circ\text{C}$
