### What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

		Total of all pins (When duty $\leq 70\%$ <sup>Note 3</sup> )	$2.4\text{ V} \leq \text{V}_{\text{DD}} \leq 5.5\text{ V}$			-1.5	mA

**Notes** 1. Value of current at which the device operation is guaranteed even if the current flows from the EV<sub>DD0</sub>, EV<sub>DD1</sub>, V<sub>DD</sub> pins to an output pin.

2. Do not exceed the total current value.

3. Specification under conditions where the duty factor  $\leq 70\%$ .

The output current value that has changed to the duty factor  $> 70\%$  the duty ratio can be calculated with the following expression (when changing the duty factor from 70% to n%).

- Total output current of pins =  $(I_{\text{OH}} \times 0.7)/(n \times 0.01)$

<Example> Where  $n = 80\%$  and  $I_{\text{OH}} = -10.0\text{ mA}$

$$\text{Total output current of pins} = (-10.0 \times 0.7)/(80 \times 0.01) \cong -8.7\text{ mA}$$

However, the current that is allowed to flow into one pin does not vary depending on the duty factor.

A current higher than the absolute maximum rating must not flow into one pin.

**Caution** P00, P02 to P04, P10 to P15, P17, P43 to P45, P50, P52 to P55, P71, P74, P80 to P82, P96, and P142 to P144 do not output high level in N-ch open-drain mode.

**Remark** Unless specified otherwise, the characteristics of alternate-function pins are the same as those of the port pins.

- Notes**
1. Total current flowing into  $V_{DD}$ ,  $EV_{DD0}$ , and  $EV_{DD1}$ , including the input leakage current flowing when the level of the input pin is fixed to  $V_{DD}$ ,  $EV_{DD0}$ , and  $EV_{DD1}$ , or  $V_{SS}$ ,  $EV_{SS0}$ , and  $EV_{SS1}$ . The values below the MAX. column include the peripheral operation current. However, not including the current flowing into the A/D converter, LVD circuit, I/O port, and on-chip pull-up/pull-down resistors and the current flowing during data flash rewrite.

  5. When high-speed on-chip oscillator and high-speed system clock are stopped. When  $RTCLPC = 1$  and setting ultra-low current consumption ( $AMPHS1 = 1$ ). The current flowing into the RTC is included. However, not including the current flowing into the 12-bit interval timer and watchdog timer.
  6. Not including the current flowing into the RTC, 12-bit interval timer, and watchdog timer.
  7. Relationship between operation voltage width, operation frequency of CPU and operation mode is as below.

HS (high-speed main) mode:  $2.7\text{ V} \leq V_{DD} \leq 5.5\text{ V}@1\text{ MHz to }32\text{ MHz}$

$2.4\text{ V} \leq V_{DD} \leq 5.5\text{ V}@1\text{ MHz to }16\text{ MHz}$
