#### What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

### 1.3.14 128-pin products

- 128-pin plastic LFQFP (14 × 20 mm, 0.5 mm pitch)

**Cautions** 1. Make EV<sub>SS0</sub>, EV<sub>SS1</sub> pins the same potential as Vss pin.

2. Make V<sub>DD</sub> pin the potential that is higher than EV<sub>DD0</sub>, EV<sub>DD1</sub> pins (EV<sub>DD0</sub> = EV<sub>DD1</sub>).

3. Connect the REGC pin to Vss via a capacitor (0.47 to 1  $\mu$ F).

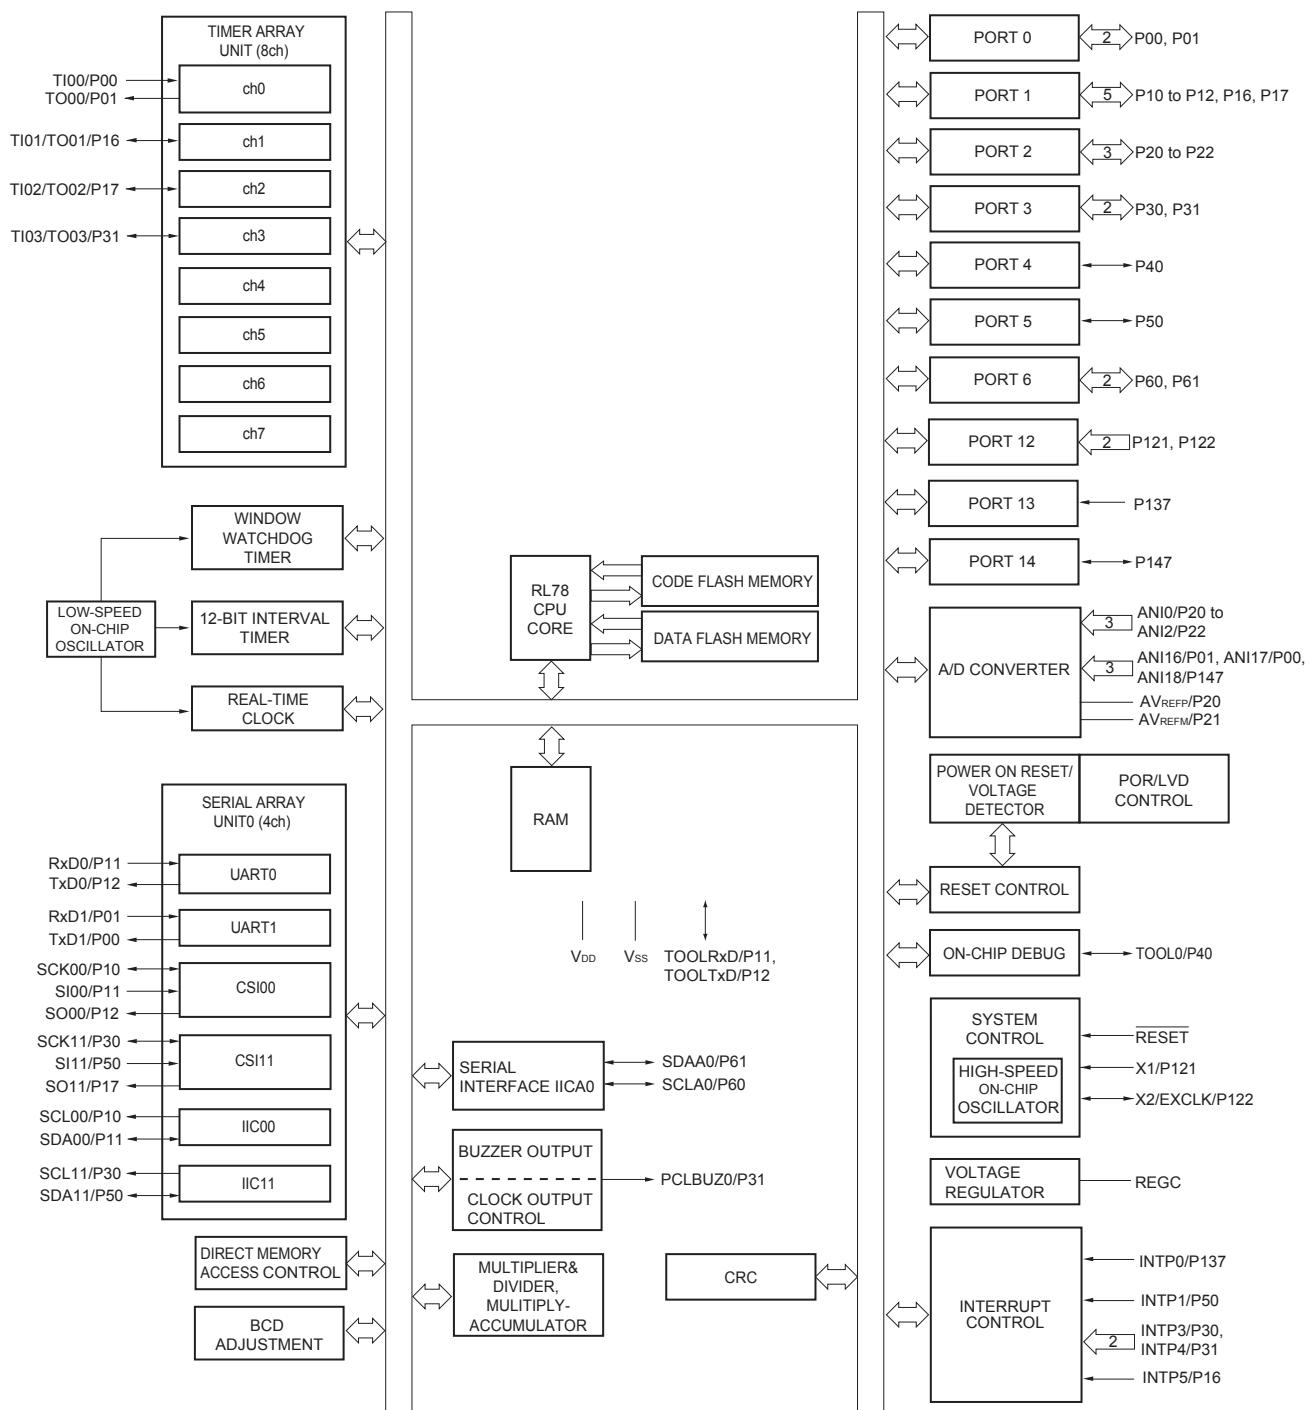

**Remarks** 1. For pin identification, see **1.4 Pin Identification**.

- When using the microcontroller for an application where the noise generated inside the microcontroller must be reduced, it is recommended to supply separate powers to the V<sub>DD</sub>, EV<sub>DD0</sub> and EV<sub>DD1</sub> pins and connect the Vss, EV<sub>SS0</sub> and EV<sub>SS1</sub> pins to separate ground lines.
- Functions in parentheses in the above figure can be assigned via settings in the peripheral I/O redirection register (PIOR). Refer to **Figure 4-8 Format of Peripheral I/O Redirection Register (PIOR)** in the RL78/G13 User's Manual.

**Caution** Product quality may suffer if the absolute maximum rating is exceeded even momentarily for any parameter. That is, the absolute maximum ratings are rated values at which the product is on the verge of suffering physical damage, and therefore the product must be used under conditions that ensure that the absolute maximum ratings are not exceeded.

**Remark** Unless specified otherwise, the characteristics of alternate-function pins are the same as those of the port pins.

	$I_{OH2}$	Per pin for P20 to P27, P150 to P156	$1.6 \text{ V} \leq V_{DD} \leq 5.5 \text{ V}$		-0.1 <sup>Note 2</sup>	mA
		Total of all pins (When duty $\leq 70\%$ <sup>Note 3</sup> )	$1.6 \text{ V} \leq V_{DD} \leq 5.5 \text{ V}$		-1.5	mA

**Notes** 1. Value of current at which the device operation is guaranteed even if the current flows from the  $EV_{DD0}$ ,  $EV_{DD1}$ ,  $V_{DD}$  pins to an output pin.

2. However, do not exceed the total current value.

3. Specification under conditions where the duty factor  $\leq 70\%$ .

The output current value that has changed to the duty factor  $> 70\%$  the duty ratio can be calculated with the following expression (when changing the duty factor from 70% to n%).

- Total output current of pins =  $(I_{OH} \times 0.7)/(n \times 0.01)$

<Example> Where n = 80% and  $I_{OH} = -10.0 \text{ mA}$

$$\text{Total output current of pins} = (-10.0 \times 0.7)/(80 \times 0.01) \approx -8.7 \text{ mA}$$

However, the current that is allowed to flow into one pin does not vary depending on the duty factor.

A current higher than the absolute maximum rating must not flow into one pin.

4. The applied current for the products for industrial application (R5F100xxDxx, R5F101xxDxx, R5F100xxGxx) is  $-100 \text{ mA}$ .

**Caution** P00, P02 to P04, P10 to P15, P17, P43 to P45, P50, P52 to P55, P71, P74, P80 to P82, P96, and P142 to P144 do not output high level in N-ch open-drain mode.

**Remark** Unless specified otherwise, the characteristics of alternate-function pins are the same as those of the port pins.

**Notes** 1. Value of current at which the device operation is guaranteed even if the current flows from the EV<sub>DD0</sub>, EV<sub>DD1</sub>, V<sub>DD</sub> pins to an output pin.

2. Do not exceed the total current value.

3. Specification under conditions where the duty factor ≤ 70%.

The output current value that has changed to the duty factor > 70% the duty ratio can be calculated with the following expression (when changing the duty factor from 70% to n%).

- Total output current of pins = (I<sub>OH</sub> × 0.7)/(n × 0.01)

<Example> Where n = 80% and I<sub>OH</sub> = -10.0 mA

$$\text{Total output current of pins} = (-10.0 \times 0.7)/(80 \times 0.01) \approx -8.7 \text{ mA}$$

However, the current that is allowed to flow into one pin does not vary depending on the duty factor.

A current higher than the absolute maximum rating must not flow into one pin.

**Caution** P00, P02 to P04, P10 to P15, P17, P43 to P45, P50, P52 to P55, P71, P74, P80 to P82, P96, and P142 to P144 do not output high level in N-ch open-drain mode.

**Remark** Unless specified otherwise, the characteristics of alternate-function pins are the same as those of the port pins.

**Notes** 1. Total current flowing into V<sub>DD</sub>, EV<sub>DD0</sub>, and EV<sub>DD1</sub>, including the input leakage current flowing when the level of the input pin is fixed to V<sub>DD</sub>, EV<sub>DD0</sub>, and EV<sub>DD1</sub>, or V<sub>SS</sub>, EV<sub>SS0</sub>, and EV<sub>SS1</sub>. The values below the MAX. column include the peripheral operation current. However, not including the current flowing into the A/D converter, LVD circuit, I/O port, and on-chip pull-up/pull-down resistors and the current flowing during data flash rewrite.
