What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

- Cautions**
1. Make EV_{SS0} pin the same potential as V_{SS} pin.
 2. Make V_{DD} pin the potential that is higher than EV_{DD0} pin.
 3. Connect the REGC pin to V_{SS} via a capacitor (0.47 to 1 μF).

- Remarks**
1. For pin identification, see 1.4 Pin Identification.
 2. When using the microcontroller for an application where the noise generated inside the microcontroller must be reduced, it is recommended to supply separate powers to the V_{DD} and EV_{DD0} pins and connect the V_{SS} and EV_{SS0} pins to separate ground lines.
 3. Functions in parentheses in the above figure can be assigned via settings in the peripheral I/O redirection register (PIOR). Refer to **Figure 4-8 Format of Peripheral I/O Redirection Register (PIOR)** in the RL78/G13 User's Manual.

Total of all pins (When duty $\leq 70\%$ ^{Note 3})		$2.4\text{ V} \leq \text{V}_{\text{DD}} \leq 5.5\text{ V}$			5.0	mA

- Notes**
- Value of current at which the device operation is guaranteed even if the current flows from an output pin to the $\text{EV}_{\text{SS}0}$, $\text{EV}_{\text{SS}1}$ and V_{SS} pin.
 - Do not exceed the total current value.
 - Specification under conditions where the duty factor $\leq 70\%$.
The output current value that has changed to the duty factor $> 70\%$ the duty ratio can be calculated with the following expression (when changing the duty factor from 70% to n%).
 - Total output current of pins = $(I_{\text{OL}} \times 0.7)/(n \times 0.01)$
<Example> Where $n = 80\%$ and $I_{\text{OL}} = 10.0\text{ mA}$
Total output current of pins = $(10.0 \times 0.7)/(80 \times 0.01) \cong 8.7\text{ mA}$
 However, the current that is allowed to flow into one pin does not vary depending on the duty factor. A current higher than the absolute maximum rating must not flow into one pin.

Remark Unless specified otherwise, the characteristics of alternate-function pins are the same as those of the port pins.
