

Welcome to [E-XFL.COM](https://www.e-xfl.com)

### What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

### Applications of "[Embedded - Microcontrollers](#)"

#### Details

Product Status	Obsolete
Core Processor	eZ8
Core Size	8-Bit
Speed	5MHz
Connectivity	IrDA, UART/USART
Peripherals	Brown-out Detect/Reset, LED, POR, PWM, WDT
Number of I/O	16
Program Memory Size	8KB (8K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	1K x 8
Voltage - Supply (Vcc/Vdd)	2.7V ~ 3.6V
Data Converters	A/D 7x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 105°C (TA)
Mounting Type	Surface Mount
Package / Case	20-SOIC (0.295", 7.50mm Width)
Supplier Device Package	-
Purchase URL	<a href="https://www.e-xfl.com/product-detail/zilog/z8f0823sh005ec">https://www.e-xfl.com/product-detail/zilog/z8f0823sh005ec</a>

# Overview

Zilog's Z8 Encore! XP<sup>®</sup> microcontroller unit (MCU) family of products are the first Zilog<sup>®</sup> microcontroller products based on the 8-bit eZ8 CPU core. Z8 Encore! XP F0823 Series products expand upon Zilog's extensive line of 8-bit microcontrollers. The Flash in-circuit programming capability allows for faster development time and program changes in the field. The new eZ8 CPU is upward compatible with existing Z8<sup>®</sup> instructions. The rich peripheral set of Z8 Encore! XP F0823 Series makes it suitable for a variety of applications including motor control, security systems, home appliances, personal electronic devices, and sensors.

## Features

The key features of Z8 Encore! XP F0823 Series include:

- 5 MHz eZ8 CPU
- 1 KB, 2 KB, 4 KB, or 8 KB Flash memory with in-circuit programming capability
- 256 B, 512 B, or 1 KB register RAM
- 6 to 24 I/O pins depending upon package
- Internal precision oscillator (IPO)
- Full-duplex UART
- The universal asynchronous receiver/transmitter (UART) baud rate generator (BRG) can be configured and used as a basic 16-bit timer
- Infrared data association (IrDA)-compliant infrared encoder/decoders, integrated with UART
- Two enhanced 16-bit timers with capture, compare, and PWM capability
- Watchdog Timer (WDT) with dedicated internal RC oscillator
- On-Chip Debugger (OCD)
- Optional 8-channel, 10-bit Analog-to-Digital Converter (ADC)
- On-Chip analog comparator
- Up to 20 vectored interrupts
- Direct LED drive with programmable drive strengths
- Voltage Brownout (VBO) protection
- Power-On Reset (POR)

# Register Map

Table 8 lists the address map for the Register File of the Z8 Encore! XP<sup>®</sup> F0823 Series devices. Not all devices and package styles in the Z8 Encore! XP F0823 Series support the ADC, or all GPIO ports. Consider registers for unimplemented peripherals as reserved.

**Table 8. Register File Address Map**

Address (Hex)	Register Description	Mnemonic	Reset (Hex)	Page No
<b>General-Purpose RAM</b>				
<b>Z8F0823/Z8F0813 Devices</b>				
000–3FF	General-Purpose Register File RAM	—	XX	
400–EFF	Reserved	—	XX	
<b>Z8F0423/Z8F0413 Devices</b>				
000–3FF	General-Purpose Register File RAM	—	XX	
400–EFF	Reserved	—	XX	
<b>Z8F0223/Z8F0213 Devices</b>				
000–1FF	General-Purpose Register File RAM	—	XX	
200–EFF	Reserved	—	XX	
<b>Z8F0123/Z8F0113 Devices</b>				
000–0FF	General-Purpose Register File RAM	—	XX	
100–EFF	Reserved	—	XX	
<b>Timer 0</b>				
F00	Timer 0 High Byte	T0H	00	80
F01	Timer 0 Low Byte	T0L	01	80
F02	Timer 0 Reload High Byte	T0RH	FF	81
F03	Timer 0 Reload Low Byte	T0RL	FF	81
F04	Timer 0 PWM High Byte	T0PWMH	00	81
F05	Timer 0 PWM Low Byte	T0PWML	00	82
F06	Timer 0 Control 0	T0CTL0	00	82
F07	Timer 0 Control 1	T0CTL1	00	83
<b>Timer 1</b>

FFE	Stack Pointer High Byte	SPH	XX	
FFF	Stack Pointer Low Byte	SPL	XX	
XX=Undefined				

**Figure 6. Voltage Brownout Reset Operation**

The POR level is greater than the VBO level by the specified hysteresis value. This ensures that the device undergoes a POR after recovering from a VBO condition.

## Watchdog Timer Reset

If the device is in NORMAL or STOP mode, the Watchdog Timer can initiate a System Reset at time-out if the WDT\_RES Flash Option Bit is programmed to 1. This is the unprogrammed state of the WDT\_RES Flash Option Bit. If the bit is programmed to 0, it configures the Watchdog Timer to cause an interrupt, not a System Reset, at time-out.

The WDT status bit in the WDT Control register is set to signify that the reset was initiated by the Watchdog Timer.

## External Reset Input

The  $\overline{\text{RESET}}$  pin has a Schmitt-Triggered input and an internal pull-up resistor. Once the  $\overline{\text{RESET}}$  pin is asserted for a minimum of four system clock cycles, the device progresses through the System Reset sequence. Because of the possible asynchronicity of the system

PA0 and PA6 contain two different timer functions, a timer input and a complementary timer output. Both of these functions require the same GPIO configuration, the selection between the two is based on the timer mode. For more details, see Timers on page 67.

**! Caution:** *For pin with multiple alternate functions, it is recommended to write to the AFS1 and AFS2 sub-registers before enabling the alternate function via the AF sub-register. This prevents spurious transitions through unwanted alternate function modes.*

## Direct LED Drive

The Port C pins provide a current sinked output capable of driving an LED without requiring an external resistor. The output sinks current at programmable levels of 3 mA, 7 mA, 13 mA, and 20 mA. This mode is enabled through the Alternate Function sub-register AFS1 and is programmable through the LED control registers. The LED Drive Enable (LEDEN) register turns on the drivers. The LED Drive Level (LEDLVLH and LEDLVLL) registers select the sink current.

For correct function, the LED anode must be connected to  $V_{DD}$  and the cathode to the GPIO pin. Using all Port C pins in LED drive mode with maximum current can result in excessive total current. For the maximum total current for the applicable package, see Electrical Characteristics on page 193.

## Shared Reset Pin

On the 8-pin product versions, the reset pin is shared with PA2, but the pin is not limited to output-only when in GPIO mode.

**! Caution:** *If PA2 on the 8-pin product is reconfigured as an input, take care that no external stimulus drives the pin Low during any reset sequence. Since PA2 returns to its RESET alternate function during system resets, driving it Low holds the chip in a reset state until the pin is released.*

## Shared Debug Pin

On the 8-pin version of this device only, the Debug pin shares function with the PA0 GPIO pin. This pin performs as a general purpose input pin on power-up, but the debug logic monitors this pin during the reset sequence to determine if the unlock sequence occurs. If the unlock sequence is present, the debug function is unlocked and the pin no longer func-

6. Write to the Timer Control register to enable the timer and initiate counting.

In ONE-SHOT mode, the system clock always provides the timer input. The timer period is given by the following equation:

$$\text{ONE-SHOT Mode Time-Out Period (s)} = \frac{(\text{Reload Value} - \text{Start Value}) \times \text{Prescale}}{\text{System Clock Frequency (Hz)}}$$

### **CONTINUOUS Mode**

In CONTINUOUS mode, the timer counts up to the 16-bit Reload value stored in the Timer Reload High and Low Byte registers. The timer input is the system clock. Upon reaching the Reload value, the timer generates an interrupt, the count value in the Timer High and Low Byte registers is reset to 0001H and counting resumes. Also, if the Timer Output alternate function is enabled, the Timer Output pin changes state (from Low to High or from High to Low) at timer Reload.

Follow the steps below to configure a timer for CONTINUOUS mode and to initiate the count:

1. Write to the Timer Control register to:
  - Disable the timer
  - Configure the timer for CONTINUOUS mode
  - Set the prescale value
  - If using the Timer Output alternate function, set the initial output level (High or Low)
2. Write to the Timer High and Low Byte registers to set the starting count value (usually 0001H). This action only affects the first pass in CONTINUOUS mode. After the first timer Reload in CONTINUOUS mode, counting always begins at the reset value of 0001H.
3. Write to the Timer Reload High and Low Byte registers to set the Reload value.
4. Enable the timer interrupt (if appropriate) and set the timer interrupt priority by writing to the relevant interrupt registers.
5. Configure the associated GPIO port pin (if using the Timer Output function) for the Timer Output alternate function.
6. Write to the Timer Control register to enable the timer and initiate counting.

In CONTINUOUS mode, the system clock always provides the timer input. The timer period is given by the following equation:

$$\text{CONTINUOUS Mode Time-Out Period (s)} = \frac{\text{Reload Value} \times \text{Prescale}}{\text{System Clock Frequency (Hz)}}$$

If an initial starting value other than 0001H is loaded into the Timer High and Low Byte registers, use the ONE-SHOT mode equation to determine the first time-out period.

## COUNTER Mode

In COUNTER mode, the timer counts input transitions from a GPIO port pin. The timer input is taken from the GPIO port pin Timer Input alternate function. The **TPOL** bit in the Timer Control register selects whether the count occurs on the rising edge or the falling edge of the timer input signal. In COUNTER mode, the prescaler is disabled.

**! Caution:** *The input frequency of the timer input signal must not exceed one-fourth the system clock frequency.*

Upon reaching the Reload value stored in the Timer Reload High and Low Byte registers, the timer generates an interrupt, the count value in the Timer High and Low Byte registers is reset to 0001H and counting resumes. Also, if the Timer Output alternate function is enabled, the Timer Output pin changes state (from Low to High or from High to Low) at timer Reload.

Follow the steps below for configuring a timer for COUNTER mode and initiating the count:

1. Write to the Timer Control register to:
  - Disable the timer.
  - Configure the timer for COUNTER mode.
  - Select either the rising edge or falling edge of the Timer Input signal for the count. This selection also sets the initial logic level (High or Low) for the Timer Output alternate function. However, the Timer Output function is not required to be enabled.
2. Write to the Timer High and Low Byte registers to set the starting count value. This only affects the first pass in COUNTER mode. After the first timer Reload in COUNTER mode, counting always begins at the reset value of 0001H. In COUNTER mode the Timer High and Low Byte registers must be written with the value 0001H.
3. Write to the Timer Reload High and Low Byte registers to set the Reload value.
4. If appropriate, enable the timer interrupt and set the timer interrupt priority by writing to the relevant interrupt registers.
5. Configure the associated GPIO port pin for the Timer Input alternate function.
6. If using the Timer Output function, configure the associated GPIO port pin for the Timer Output alternate function.
7. Write to the Timer Control register to enable the timer.

In COUNTER mode, the number of Timer Input transitions since the timer start is given by the following equation:

$$\text{COUNTER Mode Timer Input Transitions} = \text{Current Count Value} - \text{Start Value}$$

(BRG[15:0]) that sets the data transmission rate (baud rate) of the UART. The UART data rate is calculated using the following equation:

$$\text{UART Data Rate (bits/s)} = \frac{\text{System Clock Frequency (Hz)}}{16 \times \text{UART Baud Rate Divisor Value}}$$

When the UART is disabled, the Baud Rate Generator functions as a basic 16-bit timer with interrupt on time-out. Follow the steps below to configure the Baud Rate Generator as a timer with interrupt on time-out:

1. Disable the UART by clearing the REN and TEN bits in the UART Control 0 register to 0.
2. Load the acceptable 16-bit count value into the UART Baud Rate High and Low Byte registers.
3. Enable the Baud Rate Generator timer function and associated interrupt by setting the BIRQ bit in the UART Control 1 register to 1.

When configured as a general purpose timer, the interrupt interval is calculated using the following equation:

$$\text{Interrupt Interval (s)} = \text{System Clock Period (s)} \times \text{BRG}[15:0]$$

## UART Control Register Definitions

The UART control registers support the UART and the associated Infrared Encoder/Decoders. For more information on the infrared operation, see Infrared Encoder/Decoder on page 113.

### UART Transmit Data Register

Data bytes written to the UART Transmit Data register (Table 62) are shifted out on the TXD<sub>x</sub> pin. The Write-only UART Transmit Data register shares a Register File address with the read-only UART Receive Data register.

**Table 62. UART Transmit Data Register (U0TXD)**

BITS	7	6	5	4	3	2	1	0
FIELD	TXD							
RESET	X	X	X	X	X	X	X	X
R/W	W	W	W	W	W	W	W	W
ADDR	F40H							

TXD—Transmit Data

UART transmitter data byte to be shifted out through the TXD<sub>x</sub> pin.

5. When the conversion is complete, the ADC control logic performs the following operations:
  - 11-bit two's-complement result written to {ADCD\_H[7:0], ADCD\_L[7:5]}.
  - CEN resets to 0 to indicate the conversion is complete.
6. If the ADC remains idle for 160 consecutive system clock cycles, it is automatically powered-down.

## Continuous Conversion

When configured for continuous conversion, the ADC continuously performs an analog-to-digital conversion on the selected analog input. Each new data value over-writes the previous value stored in the ADC Data registers. An interrupt is generated after each conversion.

**! Caution:** *In CONTINUOUS mode, ADC updates are limited by the input signal bandwidth of the ADC and the latency of the ADC and its digital filter. Step changes at the input are not detected at the next output from the ADC. The response of the ADC (in all modes) is limited by the input signal bandwidth and the latency.*

Follow the steps below for setting up the ADC and initiating continuous conversion:

1. Enable the acceptable analog input by configuring the general-purpose I/O pins for alternate function. This action disables the digital input and output driver.
2. Write the ADC Control/Status Register 1 to configure the ADC:
  - Write the REFSELH bit of the pair {REFSELH, REFSELL} to select the internal voltage reference level or to disable the internal reference. The REFSELH bit is contained in the ADC Control/Status Register 1.
3. Write to the ADC Control Register 0 to configure the ADC for continuous conversion. The bit fields in the ADC Control register can be written simultaneously:
  - Write to the ANAIN[3:0] field to select from the available analog input sources (different input pins available depending on the device).
  - Set CONT to 1 to select continuous conversion.
  - If the internal VREF must be output to a pin, set the REFEXT bit to 1. The internal voltage reference must be enabled in this case.
  - Write the REFSELL bit of the pair {REFSELH, REFSELL} to select the internal voltage reference level or to disable the internal reference. The REFSELL bit is contained in ADC Control Register 0.
  - Set CEN to 1 to start the conversions.

► **Note:** *This bit only enables the crystal oscillator. Its selection as system clock must be done manually.*  
*0 = Crystal oscillator is enabled during reset, resulting in longer reset timing*  
*1 = Crystal oscillator is disabled during reset, resulting in shorter reset timing*

⚡ **Warning:** *Programming the XTLDIS bit to zero on 8-pin versions of this device prevents any further communication via the debug pin. This is due to the fact that the XIN and DBG functions are shared on pin 2 of this package. Do not program this bit to zero on 8-pin devices unless no further debugging or Flash programming is required.*

## Trim Bit Address Space

All available Trim bit addresses and their functions are listed in Table 89 through Table 91.

### Trim Bit Address 0000H—Reserved

Table 89. Trim Options Bits at Address 0000H

BITS	7	6	5	4	3	2	1	0
FIELD	Reserved							
RESET	U	U	U	U	U	U	U	U
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
ADDR	Information Page Memory 0020H							
Note: U = Unchanged by Reset. R/W = Read/Write.								

Reserved—Altering this register may result in incorrect device operation.

### Trim Bit Address 0001H—Reserved

Table 90. Trim Option Bits at 0001H

BITS	7	6	5	4	3	2	1	0
FIELD	Reserved							
RESET	U	U	U	U	U	U	U	U
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
ADDR	Information Page Memory 0021H							
Note: U = Unchanged by Reset. R/W = Read/Write.								

Software Compensation Procedure on page 122. The location of each calibration byte is provided in Table 93 on page 148.

**Table 93. ADC Calibration Data Location**

Info Page Address	Memory Address	Compensation Usage	ADC Mode	Reference Type
60	FE60	Offset	Single-Ended Unbuffered	Internal 2.0 V
08	FE08	Gain High Byte	Single-Ended Unbuffered	Internal 2.0 V
09	FE09	Gain Low Byte	Single-Ended Unbuffered	Internal 2.0 V
63	FE63	Offset	Single-Ended Unbuffered	Internal 1.0 V
0A	FE0A	Gain High Byte	Single-Ended Unbuffered	Internal 1.0 V
0B	FE0B	Gain Low Byte	Single-Ended Unbuffered	Internal 1.0 V
66	FE66	Offset	Single-Ended Unbuffered	External 2.0 V
0C	FE0C	Gain High Byte	Single-Ended Unbuffered	External 2.0 V
0D	FE0D	Gain Low Byte	Single-Ended Unbuffered	External 2.0 V

## Serialization Data

**Table 94. Serial Number at 001C-001F (S\_NUM)**

BITS	7	6	5	4	3	2	1	0
FIELD	S_NUM							
RESET	U	U	U	U	U	U	U	U
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
ADDR	Information Page Memory 001C-001F							
Note: U = Unchanged by Reset. R/W = Read/Write.								

S\_NUM— Serial Number Byte

The serial number is a unique four-byte binary value.

# eZ8 CPU Instruction Set

## Assembly Language Programming Introduction

The eZ8 CPU assembly language provides a means for writing an application program without concern for actual memory addresses or machine instruction formats. A program written in assembly language is called a source program. Assembly language allows the use of symbolic addresses to identify memory locations. It also allows mnemonic codes (opcodes and operands) to represent the instructions themselves. The opcodes identify the instruction while the operands represent memory locations, registers, or immediate data values.

Each assembly language program consists of a series of symbolic commands called statements. Each statement can contain labels, operations, operands, and comments.

Labels are assigned to a particular instruction step in a source program. The label identifies that step in the program as an entry point for use by other instructions.

The assembly language also includes assembler directives that supplement the machine instruction. The assembler directives, or pseudo-ops, are not translated into a machine instruction. Rather, the pseudo-ops are interpreted as directives that control or assist the assembly process.

The source program is processed (assembled) by the assembler to obtain a machine language program called the object code. The object code is executed by the eZ8 CPU. An example segment of an assembly language program is detailed in the following example.

### Assembly Language Source Program Example

```
JP  START          ; Everything after the semicolon is a comment.

START:             ; A label called 'START'. The first instruction (JP  START) in this
                  ; example causes program execution to jump to the point within the
                  ; program where the START label occurs.

LD  R4, R7         ; A Load (LD) instruction with two operands. The first operand,
                  ; Working Register R4, is the destination. The second operand,
                  ; Working Register R7, is the source. The contents of R7 is
                  ; written into R4.

LD  234H, #01      ; Another Load (LD) instruction with two operands.
                  ; The first operand, Extended Mode Register Address 234H,
                  ; identifies the destination. The second operand, Immediate Data
                  ; value 01H, is the source. The value 01H is written into the
                  ; Register at address 234H.
```

Assembly Mnemonic	Symbolic Operation	Address Mode			Opcode(s) (Hex)	Flags					Fetch Cycles	Instr. Cycles

Ir	Indirect Working Register	RA	Relative
IR	Indirect register	rr	Working Register Pair
Irr	Indirect Working Register Pair	RR	Register Pair

**Table 117. Absolute Maximum Ratings (Continued)**

Parameter	Minimum	Maximum	Units	Notes
Maximum current into $V_{DD}$ or out of $V_{SS}$		125	mA	
Operating temperature is specified in DC Characteristics.				
1. This voltage applies to all pins except the following: $V_{DD}$ , $AV_{DD}$ , pins supporting analog input (Port B[5:0], Port C[2:0]) and pins supporting the crystal oscillator (PA0 and PA1). On the 8-pin packages, this applies to all pins but $V_{DD}$ .				
2. This voltage applies to pins on the 20/28 pin packages supporting analog input (Port B[5:0], Port C[2:0]) and pins supporting the crystal oscillator (PA0 and PA1).				

## DC Characteristics

Table 118 lists the DC characteristics of the Z8 Encore! XP<sup>®</sup> F0823 Series products. All voltages are referenced to  $V_{SS}$ , the primary system ground.

**Table 118. DC Characteristics**

Symbol	Parameter	$T_A = -40\text{ }^{\circ}\text{C to }+105\text{ }^{\circ}\text{C}$ (unless otherwise specified)			Units	Conditions
		Minimum	Typical	Maximum		
$V_{DD}$	Supply Voltage	2.7	–	3.6	V	
$V_{IL1}$	Low Level Input Voltage	-0.3	–	$0.3 \cdot V_{DD}$	V	
$V_{IH1}$	High Level Input Voltage	$0.7 \cdot V_{DD}$	–	5.5	V	For all input pins without analog or oscillator function. For all signal pins on the 8-pin devices. Programmable pull-ups must also be disabled.
$V_{IH2}$	High Level Input Voltage	$0.7 \cdot V_{DD}$	–	$V_{DD} + 0.3$	V	For those pins with analog or oscillator function (20-/28-pin devices only), or when programmable pull-ups are enabled.
$V_{OL1}$	Low Level Output Voltage	–	–	0.4	V	$I_{OL} = 2\text{ mA}$ ; $V_{DD} = 3.0\text{ V}$ High Output Drive disabled.
$V_{OH1}$	High Level Output Voltage	2.4	–	–	V	$I_{OH} = -2\text{ mA}$ ; $V_{DD} = 3.0\text{ V}$ High Output Drive disabled.
$V_{OL2}$	Low Level Output Voltage	–	–	0.6	V	$I_{OL} = 20\text{ mA}$ ; $V_{DD} = 3.3\text{ V}$ High Output Drive enabled.

**Table 125. Analog-to-Digital Converter Electrical Characteristics and Timing**

Symbol	Parameter	$V_{DD} = 3.0 \text{ V to } 3.6 \text{ V}$ $T_A = 0 \text{ }^{\circ}\text{C to } +70 \text{ }^{\circ}\text{C}$ (unless otherwise stated)			Units	Conditions
		Minimum	Typical	Maximum		
	Resolution	10		–	bits	
	Differential Nonlinearity (DNL)	-1.0	–	1.0	LSB <sup>3</sup>	External $V_{REF} = 2.0 \text{ V}$ ; $R_S \leftarrow 3.0 \text{ k}\Omega$
	Integral Nonlinearity (INL)	-3.0	–	3.0	LSB <sup>3</sup>	External $V_{REF} = 2.0 \text{ V}$ ; $R_S \leftarrow 3.0 \text{ k}\Omega$
	Offset Error with Calibration		$\pm 1$		LSB <sup>3</sup>	
	Absolute Accuracy with Calibration		$\pm 3$		LSB <sup>3</sup>	
$V_{REF}$	Internal Reference Voltage	1.0 2.0	1.1 2.2	1.2 2.4	V	REFSEL=01 REFSEL=10
$V_{REF}$	Internal Reference Variation with Temperature		$\pm 1.0$		%	Temperature variation with $V_{DD} = 3.0$
$V_{REF}$	Internal Reference Voltage Variation with $V_{DD}$		$\pm 0.5$		%	Supply voltage variation with $T_A = 30 \text{ }^{\circ}\text{C}$
$R_{REFOUT}$	Reference Buffer Output Impedance		850		$\Omega$	When the internal reference is buffered and driven out to the $V_{REF}$ pin (REFOUT = 1)
	Single-Shot Conversion Time	–	5129	–	System clock cycles	All measurements but temperature sensor
			10258			Temperature sensor measurement
	Continuous Conversion Time	–	256	–	System clock cycles	All measurements but temperature sensor
			512			Temperature sensor measurement
	Signal Input Bandwidth	–	10		kHz	As defined by -3 dB point
$R_S$	Analog Source Impedance <sup>4</sup>	–	–	10	k $\Omega$	In unbuffered mode

Figure 40 displays the 28-pin Plastic Dual Inline Package (PDIP) available for Z8 Encore! XP F0823 Series devices.

OPTION TABLE	
OPTION #	PACKAGE
01	STANDARD
02	IDF

Note: ZILOG supplies both options for production. Component layout  
PCB design should cover bigger option 01.
