What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

[1]For devices with prod. rev. < 19, Typ = 7MHz and Min/Max values not applicable.

[2]For devices with prod. rev. < 19, Typ = 1MHz and Min/Max values not applicable.

[3]The TUNING field in the CMU_HFRCOCTRL register may be used to adjust the HFRCO frequency. There is enough adjustment range to ensure that the frequency bands above 7 MHz will always have some overlap across supply voltage and temperature. By using a stable frequency reference such as the LFXO or HFXO, a firmware calibration routine can vary the TUNING bits and the frequency band to maintain the HFRCO frequency at any arbitrary value between 7 MHz and 28 MHz across operating conditions.

[1]On the average every ADC will have one missing code, most likely to appear around 2048 +/- n*512 where n can be a value in the set {-3, -2, -1, 1, 2, 3}. There will be no missing code around 2048, and in spite of the missing code the ADC will be monotonic at all times so that a response to a slowly increasing input will always be a slowly increasing output. Around the one code that is missing, the neighbour codes will look wider in the DNL plot. The spectra will show spurs on the level of -78dBc for a full scale input for chips that have the missing code issue.
[2]Typical numbers given by abs(Mean) / (85 - 25).
[3]Max number given by (abs(Mean) + 3x stddev) / (85 - 25).

The integral non-linearity (INL) and differential non-linearity parameters are explained in Figure 3.17 (p. 32) and Figure 3.18 (p. 33) , respectively.

t_{OSU_WEn} [1 2 3 4 5]	Output setup time, from EBI_AD, EBI_A, EBI_CSn, EBI_BLn valid to leading EBI_WEn/ EBI_NANDWEn edge	-14.00 + (WRSETUP * $t_{HFCORECLK}$)			ns
t_{WIDTH_WEn} [1 2 3 4 5]	EBI_WEn/EBI_NANDWEn pulse width	-7.00 + ((WRSTRB +1) * $t_{HFCORECLK}$)			ns

[1]Applies for all addressing modes (figure only shows D16 addressing mode)
[2]Applies for both EBI_WEn and EBI_NANWEn (figure only shows EBI_WEn)
[3]Applies for all polarities (figure only shows active low signals)
[4]Measurement done at 10% and 90% of V_{DD} (figure shows 50% of $_{VDD}$)
[5] The figure shows the timing for the case that the half strobe length functionality is not used, i.e. HALFWE=0. The leading edge of EBI_WEn can be moved to the right by setting HALFWE=1. This decreases the length of t_{WIDTH_WEn} and increases the length of t_{OSU_WEn} by 1/2 * $t_{HFCLKNODIV}$.
