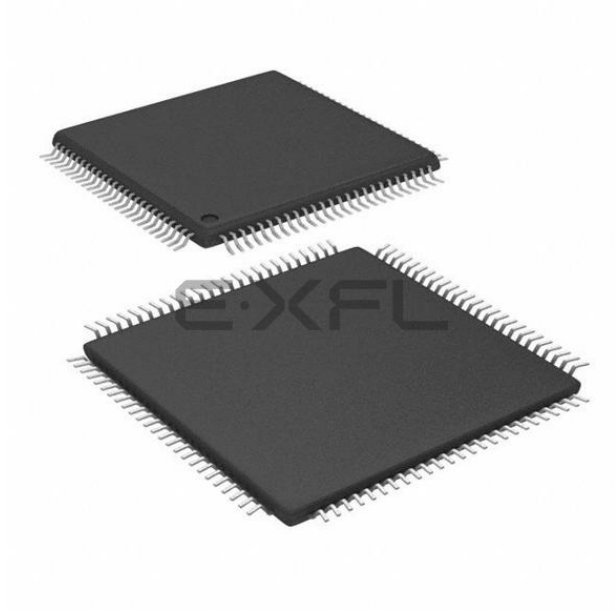
Microchip Technology - PIC24FJ128DA110T-I/PT Datasheet



Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Obsolete
Core Processor	PIC
Core Size	16-Bit
Speed	32MHz
Connectivity	I²C, IrDA, SPI, UART/USART, USB OTG
Peripherals	Brown-out Detect/Reset, GFX, LVD, POR, PWM, WDT
Number of I/O	84
Program Memory Size	128KB (43K x 24)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	24K x 8
Voltage - Supply (Vcc/Vdd)	2.2V ~ 3.6V
Data Converters	A/D 24x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	100-TQFP
Supplier Device Package	100-TQFP (12x12)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic24fj128da110t-i-pt

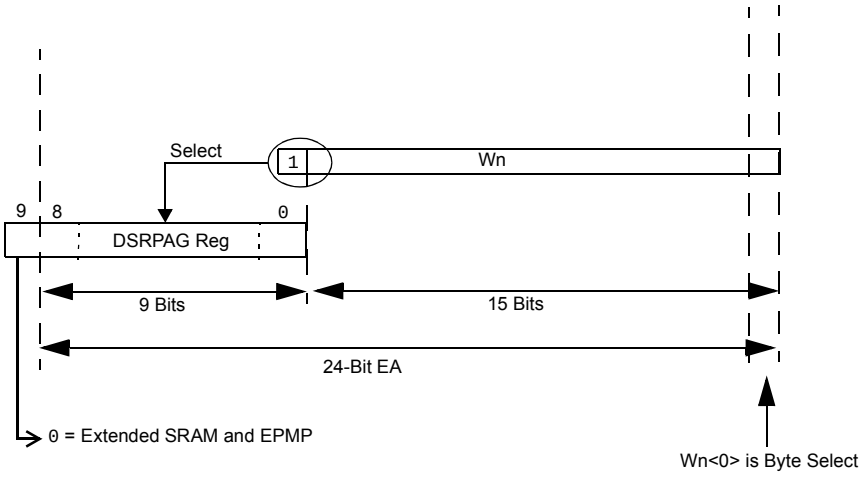
Legend: — = unimplemented, read as '0', r = reserved, maintain as '0'. Reset values are shown in hexadecimal.
Note 1: Unimplemented in 64-pin devices, read as '0'

4.2.5.1 Data Read from EDS Space

In order to read the data from the EDS space, first, an Address Pointer is set up by loading the required EDS page number into the DSRPAG register and assigning the offset address to one of the W registers. Once the above assignment is done, the EDS window is enabled by setting bit 15 of the working register, assigned with the offset address; then, the contents of the pointed EDS location can be read.

Figure 4-5 illustrates how the EDS space address is generated for read operations.

FIGURE 4-5: EDS ADDRESS GENERATION FOR READ OPERATIONS



When the Most Significant bit (MSBs) of EA is '1' and DSRPAG<9> = 0, the lower 9 bits of DSRPAG are concatenated to the lower 15 bits of EA to form a 24-bit EDS space address for read operations.

Example 4-1 shows how to read a byte, word and double-word from EDS.

Note:	All read operations from EDS space have an overhead of one instruction cycle. Therefore, a minimum of two instruction cycles is required to complete an EDS read. EDS reads under the REPEAT instruction; the first two accesses take three cycles and the subsequent accesses take one cycle.

EXAMPLE 4-1: EDS READ CODE IN ASSEMBLY

```
; Set the EDS page from where the data to be read
    mov        #0x0002 , w0
    mov        w0 , DSRPAG    ;page 2 is selected for read
    mov        #0x0800 ,  w1  ;select the location (0x800) to be read
bset       w1 , #15       ;set the MSB of the base address, enable EDS mode

;Read a byte from the selected location
    mov.b      [w1++] ,   w2  ;read Low byte
    mov.b      [w1++] , w3    ;read High byte

;Read a word from the selected location
    mov        [w1] , w2      ;

;Read Double - word from the selected location
    mov.d      [w1] , w2      ;two word read, stored in w2 and w3
```

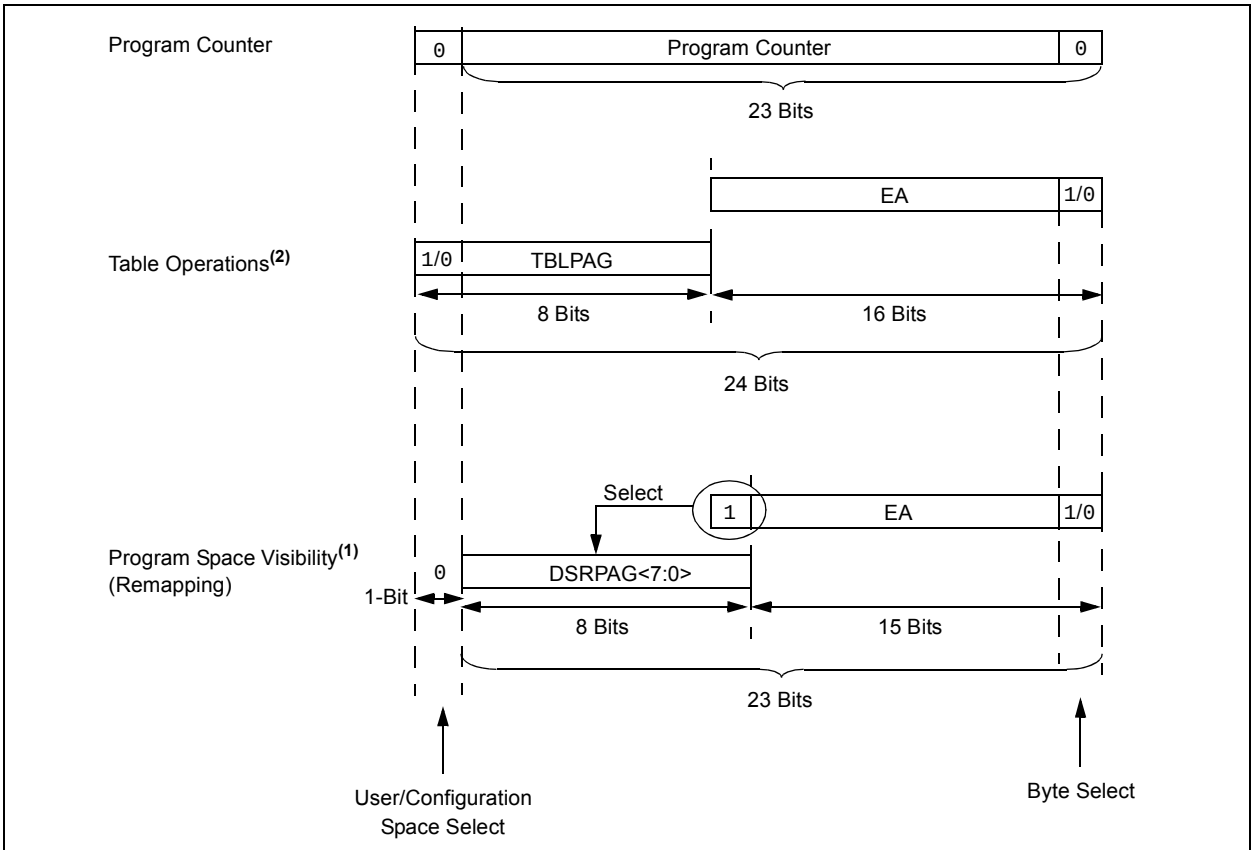
TABLE 4-36: PROGRAM SPACE ADDRESS CONSTRUCTION

Access Type	Access Space	Program Space Address				
		<23>	<22:16>	<15>	<14:1>	<0>
Instruction Access (Code Execution)	User	0	PC<22:1>			0
		0xx xxxx xxxx xxxx xxxx xxx0				
TBLRD/TBLWT (Byte/Word Read/Write)	User	TBLPAG<7:0>		Data EA<15:0>		
		0xxx xxxx		xxxx xxxx xxxx xxxx		
	Configuration	TBLPAG<7:0>		Data EA<15:0>		
		1xxx xxxx		xxxx xxxx xxxx xxxx		
Program Space Visibility (Block Remap/Read)	User	0	DSRPAG<7:0>(2)		Data EA<14:0>(1)	
		0	xxxx xxxx		xxx xxxx xxxx xxxx	

Note 1: Data EA<15> is always '1' in this case, but is not used in calculating the program space address. Bit 15 of the address is DSRPAG<0>.

2: DSRPAG<9> is always '1' in this case. DSRPAG<8> decides whether the lower word or higher word of program memory is read. When DSRPAG<8> is '0', the lower word is read and when it is '1', the higher word is read.

FIGURE 4-8: DATA ACCESS FROM PROGRAM SPACE ADDRESS GENERATION



Note 1: DSRPAG<8> acts as word select. DSRPAG<9> should always be '1' to map program memory to data memory.

2: The instructions, TBLRDH/TBLWTH/TBLRDL/TBLWTL, decide if the higher or lower word of program memory is accessed. TBLRDH/TBLWTH instructions access the higher word and TBLRDL/TBLWTL instructions access the lower word. Table read operations are permitted in the configuration memory space.

Note 1: Never use an OC module as its own trigger source, either by selecting this mode or another equivalent SYNCSEL setting.
2: Use these inputs as trigger sources only and never as sync sources.
3: The DCB<1:0> bits are double-buffered in the PWM modes only (OCM<2:0> (OCxCON1<2:0>) = 111, 110).

16.0 INTER-INTEGRATED CIRCUIT™ (I^2C™)

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information, refer to the *"PIC24F Family Reference Manual"*, **Section 24. "Inter-Integrated Circuit™ (I^2C™)"** (DS39702). The information in this data sheet supersedes the information in the FRM.

The Inter-Integrated Circuit™ (I^2C™) module is a serial interface useful for communicating with other peripheral or microcontroller devices. These peripheral devices may be serial EEPROMs, display drivers, A/D Converters, etc.

The I^2C module supports these features:

- Independent master and slave logic
- 7-bit and 10-bit device addresses
- General call address, as defined in the I^2C protocol
- Clock stretching to provide delays for the processor to respond to a slave data request
- Both 100 kHz and 400 kHz bus specifications
- Configurable address masking
- Multi-Master modes to prevent loss of messages in arbitration
- Bus Repeater mode, allowing the acceptance of all messages as a slave regardless of the address
- Automatic SCL

A block diagram of the module is shown in Figure 16-1.

16.1 Communicating as a Master in a Single Master Environment

The details of sending a message in Master mode depends on the communications protocol for the device being communicated with. Typically, the sequence of events is as follows:

1. Assert a Start condition on SDAx and SCLx.
2. Send the I^2C device address byte to the slave with a write indication.
3. Wait for and verify an Acknowledge from the slave.
4. Send the first data byte (sometimes known as the command) to the slave.
5. Wait for and verify an Acknowledge from the slave.
6. Send the serial memory address low byte to the slave.
7. Repeat steps 4 and 5 until all data bytes are sent.
8. Assert a Repeated Start condition on SDAx and SCLx.
9. Send the device address byte to the slave with a read indication.
10. Wait for and verify an Acknowledge from the slave.
11. Enable master reception to receive serial memory data.
12. Generate an ACK or NACK condition at the end of a received byte of data.
13. Generate a Stop condition on SDAx and SCLx.

REGISTER 16-2: I2CxSTAT: I2Cx STATUS REGISTER (CONTINUED)

bit 4 **P:** Stop bit
1 = Indicates that a Stop bit has been detected last
0 = Stop bit was not detected last
Hardware is set or clear when Start, Repeated Start or Stop is detected.

bit 3 **S:** Start bit
1 = Indicates that a Start (or Repeated Start) bit has been detected last
0 = Start bit was not detected last
Hardware is set or clear when Start, Repeated Start or Stop is detected.

bit 2 **R/$\overline{W}$:** Read/$\overline{\text{Write}}$ Information bit (when operating as I^2C slave)
1 = Read – indicates data transfer is output from slave
0 = Write – indicates data transfer is input to slave
Hardware is set or clear after the reception of an I^2C device address byte.

bit 1 **RBF:** Receive Buffer Full Status bit
1 = Receive is complete, I2CxRCV is full
0 = Receive not complete, I2CxRCV is empty
Hardware is set when I2CxRCV is written with the received byte; hardware is clear when the software reads I2CxRCV.

bit 0 **TBF:** Transmit Buffer Full Status bit
1 = Transmit is in progress, I2CxTRN is full
0 = Transmit is complete, I2CxTRN is empty
Hardware is set when software writes to I2CxTRN; hardware is clear at the completion of data transmission.

R/W-0	R/W-0	R/W-0	R/W-0	U-0	R/W-0	R/W-0	R/W-0
CSF1	CSF0	ALP	ALMODE	—	BUSKEEP	IRQM1	IRQM0
bit 7							bit 0

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 15 **PMPEN:** Parallel Master Port Enable bit
1 = EPMP is enabled
0 = EPMP is disabled

bit 14 **Unimplemented:** Read as '0'

bit 13 **PSIDL:** Stop in Idle Mode bit
1 = Discontinue module operation when device enters Idle mode
0 = Continue module operation in Idle mode

bit 12-11 **ADRMUX<1:0>:** Address/Data Multiplexing Selection bits
11 = Lower address bits are multiplexed with data bits using 3 address phases
10 = Lower address bits are multiplexed with data bits using 2 address phases
01 = Lower address bits are multiplexed with data bits using 1 address phase
00 = Address and data appear on separate pins

bit 10 **Unimplemented:** Read as '0'

bit 9-8 **MODE<1:0>:** Parallel Port Mode Select bits
11 = Master mode
10 = Enhanced PSP; pins used are PMRD, PMWR, PMCS, PMD<7:0> and PMA<1:0>
01 = Buffered PSP; pins used are PMRD, PMWR, PMCS and PMD<7:0>
00 = Legacy Parallel Slave Port; PMRD, PMWR, PMCS and PMD<7:0> pins are used

bit 7-6 **CSF<1:0>:** Chip Select Function bits
11 = Reserved
10 = PMA<15> used for Chip Select 2, PMA<14> used for Chip Select 1
01 = PMA<15> used for Chip Select 2, PMCS1 used for Chip Select 1
00 = PMCS2 used for Chip Select 2, PMCS1 used for Chip Select 1

bit 5 **ALP:** Address Latch Polarity bit
1 = Active-high (PMALL, PMALH and PMALU)
0 = Active-low ($\overline{\text{PMALL}}$, $\overline{\text{PMALH}}$ and $\overline{\text{PMALU}}$)

bit 4 **ALMODE:** Address Latch Strobe Mode bit
1 = Enable "smart" address strobes (each address phase is only present if the current access would cause a different address in the latch than the previous address)
0 = Disable "smart" address strobes

bit 3 **Unimplemented:** Read as '0'

bit 2 **BUSKEEP:** Bus Keeper bit
1 = Data bus keeps its last value when not actively being driven
0 = Data bus is in high-impedance state when not actively being driven

bit 1-0 **IRQM<1:0>:** Interrupt Request Mode bits
11 = Interrupt generated when Read Buffer 3 is read or Write Buffer 3 is written (Buffered PSP mode), or on a read or write operation when PMA<1:0> = 11 (Addressable PSP mode only)
10 = Reserved
01 = Interrupt generated at the end of a read/write cycle
00 = No interrupt is generated

20.2 Calibration

The real-time crystal input can be calibrated using the periodic auto-adjust feature. When properly calibrated, the RTCC can provide an error of less than 3 seconds per month. This is accomplished by finding the number of error clock pulses for one minute and storing the value into the lower half of the RCFGCAL register. The 8-bit signed value loaded into the lower half of RCFGCAL is multiplied by four and will either be added or subtracted from the RTCC timer, once every minute. Refer to the following steps for RTCC calibration:

1. Using another timer resource on the device, the user must find the error of the 32.768 kHz crystal.
2. Once the error is known, it must be converted to the number of error clock pulses per minute and loaded into the RCFGCAL register.

EQUATION 20-1: RTCC CALIBRATION

Error (clocks per minute) = (Ideal Frequency† – Measured Frequency) x 60

†Ideal Frequency = 32,768H

3. a) If the oscillator is faster then ideal (negative result form Step 2), the RCFGCAL register value needs to be negative. This causes the specified number of clock pulses to be subtracted from the timer counter, once every minute.

   b) If the oscillator is slower then ideal (positive result from Step 2), the RCFGCAL register value needs to be positive. This causes the specified number of clock pulses to be added to the timer counter, once every minute.
4. Divide the number of error clocks per minute by 4 to get the correct CAL value and load the RCFGCAL register with the correct value.

   (Each 1-bit increment in CAL adds or subtracts 4 pulses).

Writes to the lower half of the RCFGCAL register should only occur when the timer is turned off or immediately after the rising edge of the seconds pulse.

Note:	It is up to the user to include in the error value the initial error of the crystal, drift due to temperature and drift due to crystal aging.

20.3 Alarm

- Configurable from half second to one year
- Enabled using the ALRMEN bit (ALCFGRPT<15>, Register 20-3)
- One-time alarm and repeat alarm options available

20.3.1 CONFIGURING THE ALARM

The alarm feature is enabled using the ALRMEN bit. This bit is cleared when an alarm is issued. Writes to ALRMVAL should only take place when ALRMEN = 0.

As shown in Figure 20-2, the interval selection of the alarm is configured through the AMASK bits (ALCFGRPT<13:10>). These bits determine which and how many digits of the alarm must match the clock value for the alarm to occur.

The alarm can also be configured to repeat based on a preconfigured interval. The amount of times this occurs, once the alarm is enabled, is stored in the ARPT bits, ARPT<7:0> (ALCFGRPT<7:0>). When the value of the ARPT bits equals 00h and the CHIME bit (ALCFGRPT<14>) is cleared, the repeat function is disabled and only a single alarm will occur. The alarm can be repeated up to 255 times by loading ARPT<7:0> with FFh.

After each alarm is issued, the value of the ARPT bits is decremented by one. Once the value has reached 00h, the alarm will be issued one last time, after which the ALRMEN bit will be cleared automatically and the alarm will turn off.

Indefinite repetition of the alarm can occur if the CHIME bit = 1. Instead of the alarm being disabled when the value of the ARPT bits reaches 00h, it rolls over to FFh and continues counting indefinitely while CHIME is set.

20.3.2 ALARM INTERRUPT

At every alarm event, an interrupt is generated. In addition, an alarm pulse output is provided that operates at half the frequency of the alarm. This output is completely synchronous to the RTCC clock and can be used as a trigger clock to other peripherals.

Note:	Changing any of the registers, other then the RCFGCAL and ALCFGRPT registers and the CHIME bit while the alarm is enabled (ALRMEN = 1), can result in a false alarm event leading to a false alarm interrupt. To avoid a false alarm event, the timer and alarm values should only be changed while the alarm is disabled (ALRMEN = 0). It is recommended that the ALCFGRPT register and CHIME bit be changed when RTCSYNC = 0.

21.0 32-BIT PROGRAMMABLE CYCLIC REDUNDANCY CHECK (CRC) GENERATOR

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information, refer to the "*PIC24F Family Reference Manual*", **Section 41. "32-Bit Programmable Cyclic Redundancy Check (CRC)"** (DS39729). The information in this data sheet supersedes the information in the FRM.

The 32-bit programmable CRC generator provides a hardware implemented method of quickly generating checksums for various networking and security applications. It offers the following features:

- User-programmable CRC polynomial equation, up to 32 bits
- Programmable shift direction (little or big-endian)
- Independent data and polynomial lengths
- Configurable interrupt output
- Data FIFO

Figure 21-1 displays a simplified block diagram of the CRC generator. A simple version of the CRC shift engine is displayed in Figure 21-2.

FIGURE 21-1: CRC BLOCK DIAGRAM

REGISTER 22-23: G1VSYNC: VERTICAL SYNCHRONIZATION CONTROL REGISTER

R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
VSLEN7	VSLEN6	VSLEN5	VSLEN4	VSLEN3	VSLEN2	VSLEN1	VSLEN0
bit 15							bit 8

R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
VSST7	VSST6	VSST5	VSST4	VSST3	VSST2	VSST1	VSST0
bit 7							bit 0

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 15-8 **VSLEN<7:0>:** VSYNC Pulse-Width Configuration bits (in lines)
The DPVSOE bit (G1CON3<1>) must be set for the VSYNC signal to toggle; minimum value is 1.

bit 7-0 **VSST<7:0>:** VSYNC Start Delay Configuration bits (in lines)
This is the number of lines from the start of vertical blanking to the start of VSYNC active.

REGISTER 22-24: G1DBLCON: DISPLAY BLANKING CONTROL REGISTER

R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
VENST7	VENST6	VENST5	VENST4	VENST3	VENST2	VENST1	VENST0
bit 15							bit 8

R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
HENST7	HENST6	HENST5	HENST4	HENST3	HENST2	HENST1	HENST0
bit 7							bit 0

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 15-8 **VENST<7:0>:** Vertical Blanking Start to First Displayed Line Configuration bits (in lines)
This is the number of lines from the start of vertical blanking to the first displayed line of a frame.

bit 7-0 **HENST<7:0>:** Horizontal Blanking Start to First Displayed Pixel Configuration bits (in DISPCLKs)
This is the number of GCLK cycles from the start of horizontal blanking to the first displayed pixel of each displayed line.

REGISTER 22-25: G1CLUT: COLOR LOOK-UP TABLE CONTROL REGISTER

R/W-0	R-0, HSC	U-0	U-0	U-0	U-0	R/W-0	R/W-0
CLUTEN	CLUTBUSY	—	—	—	—	CLUTTRD	CLUTRWEN
bit 15							bit 8

CLUTADR7	CLUTADR6	CLUTADR5	CLUTADR4	CLUTADR3	CLUTADR2	CLUTADR1	CLUTADR0
bit 7							bit 0

Legend:	HSC = Hardware Settable/Clearable bit		
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 15 **CLUTEN:** Color Look-up Table Enable Control bit
1 = Color look-up table is enabled
0 = Color look-up table is disabled

bit 14 **CLUTBUSY:** Color Look-up Table Busy Status bit
1 = A CLUT entry read/write access is being executed
0 = No CLUT entry read/write access is being executed

bit 13-10 **Unimplemented:** Read as '0'

bit 9 **CLUTTRD:** Color Look-up Table Read Trigger bit
Enabling this bit will trigger a read to the CLUT location determined by the CLUTADR bits (G1CLUT<7:0>) with CLUTRWEN enabled.
1 = CLUT read trigger is enabled (must be cleared in software after reading data in the G1CLUTRD register)
0 = CLUT read trigger is disabled

bit 8 **CLUTRWEN:** Color Look-up Table Read/Write Enable Control bit
This bit must be set when reading or modifying entries on the CLUT and it must also be cleared when CLUT is used by the display controller.
1 = Color look-up table read/write enabled; display controller cannot access the CLUT
0 = Color look-up table read/write disabled; display controller can access the CLUT

bit 7-0 **CLUTADR<7:0>:** Color Look-up Table Memory Address bits

30.0 ELECTRICAL CHARACTERISTICS

This section provides an overview of the PIC24FJ256DA210 family electrical characteristics. Additional information will be provided in future revisions of this document as it becomes available.

Absolute maximum ratings for the PIC24FJ256DA210 family are listed below. Exposure to these maximum rating conditions for extended periods may affect device reliability. Functional operation of the device at these, or any other conditions above the parameters indicated in the operation listings of this specification, is not implied.

Absolute Maximum Ratings(†)

Ambient temperature under bias ..... -40°C to +100°C
Storage temperature ..... -65°C to +150°C
Voltage on V_{DD} with respect to V_{SS} ..... -0.3V to +4.0V
Voltage on any combined analog and digital pin and MCLR, with respect to V_{SS} ..... -0.3V to (V_{DD} + 0.3V)
Voltage on any digital only pin with respect to V_{SS} when V_{DD} < 3.0V ..... -0.3V to (V_{DD} + 0.3V)
Voltage on any digital only pin with respect to V_{SS} when V_{DD} > 3.0V ..... -0.3V to (+5.5V)
Voltage on V_{BUS} pin with respect to V_{SS}, independent of V_{DD} or V_{USB} ..... -0.3V to (+5.5V)
Maximum current out of V_{SS} pin ..... 300 mA
Maximum current into V_{DD} pin **(Note 1)** ..... 250 mA
Maximum output current sunk by any I/O pin ..... 25 mA
Maximum output current sourced by any I/O pin ..... 25 mA
Maximum current sunk by all ports ..... 200 mA
Maximum current sourced by all ports **(Note 1)** ..... 200 mA

Note 1: Maximum allowable current is a function of device maximum power dissipation (see Table 30-1).

†NOTICE: Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operation listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.
