Understanding Embedded - CPLDs (Complex Programmable Logic Devices)

Embedded - CPLDs, or Complex Programmable Logic Devices, are highly versatile digital logic devices used in electronic systems. These programmable components are designed to perform complex logical operations and can be customized for specific applications. Unlike fixed-function ICs, CPLDs offer the flexibility to reprogram their configuration, making them an ideal choice for various embedded systems. They consist of a set of logic gates and programmable interconnects, allowing designers to implement complex logic circuits without needing custom hardware.

ispLSI® 1024

In-System Programmable High Density PLD

Features

- **HIGH-DENSITY PROGRAMMABLE LOGIC**
  - — High-Speed Global Interconnect
  - — 4000 PLD Gates
  - — 48 I/O Pins, Six Dedicated Inputs
  - — 144 Registers
  - — Wide Input Gating for Fast Counters, State Machines, Address Decoders, etc.
  - — Small Logic Block Size for Fast Random Logic
  - — Security Cell Prevents Unauthorized Copying
- **HIGH PERFORMANCE E²CMOS® TECHNOLOGY**
  - — f_{max} = 90 MHz Maximum Operating Frequency
  - — f_{max} = 60 MHz for Industrial and Military/883 Devices
  - — t_{pd} = 12 ns Propagation Delay
  - — TTL Compatible Inputs and Outputs
  - — Electrically Erasable and Reprogrammable
  - — Non-Volatile E²CMOS Technology
  - — 100% Tested
- **IN-SYSTEM PROGRAMMABLE**
  - — In-System Programmable™ (ISP™) 5-Volt Only
  - — Increased Manufacturing Yields, Reduced Time-to-Market, and Improved Product Quality
  - — Reprogram Soldered Devices for Faster Debugging
- **COMBINES EASE OF USE AND THE FAST SYSTEM SPEED OF PLDs WITH THE DENSITY AND FLEXIBILITY OF FIELD PROGRAMMABLE GATE ARRAYS**
  - — Complete Programmable Device Can Combine Glue Logic and Structured Designs
  - — Four Dedicated Clock Input Pins
  - — Synchronous and Asynchronous Clocks
  - — Flexible Pin Placement
  - — Optimized Global Routing Pool Provides Global Interconnectivity
- **ispDesignEXPERT™ – LOGIC COMPILER AND COMPLETE ISP DEVICE DESIGN SYSTEMS FROM HDL SYNTHESIS THROUGH IN-SYSTEM PROGRAMMING**
  - — Superior Quality of Results
  - — Tightly Integrated with Leading CAE Vendor Tools
  - — Productivity Enhancing Timing Analyzer, Explore Tools, Timing Simulator and ispANALYZER™
  - — PC and UNIX Platforms

Description

The ispLSI 1024 is a High-Density Programmable Logic Device containing 144 Registers, 48 Universal I/O pins, six Dedicated Input pins, four Dedicated Clock Input pins and a Global Routing Pool (GRP). The GRP provides complete interconnectivity between all of these elements. The ispLSI 1024 features 5-Volt in-system programmability and in-system diagnostic capabilities. It is the first device which offers non-volatile reprogrammability of the logic, as well as the interconnect to provide truly reconfigurable systems.

The basic unit of logic on the ispLSI 1024 device is the Generic Logic Block (GLB). The GLBs are labeled A0, A1 .. C7 (see figure 1). There are a total of 24 GLBs in the ispLSI 1024 device. Each GLB has 18 inputs, a programmable AND/OR/XOR array, and four outputs which can be configured to be either combinatorial or registered. Inputs to the GLB come from the GRP and dedicated inputs. All of the GLB outputs are brought back into the GRP so that they can be connected to the inputs of any other GLB on the device.

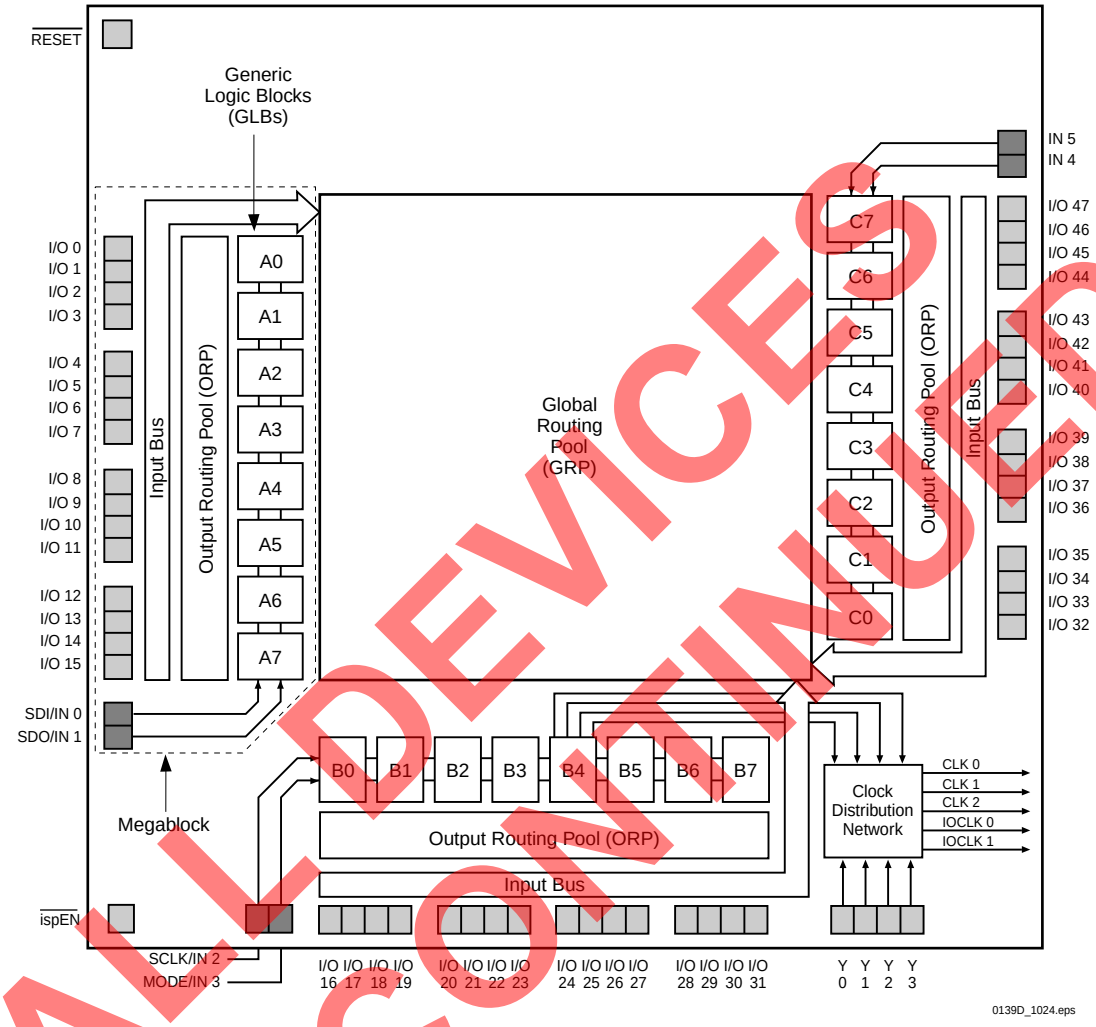
Functional Block Diagram

Figure 1.ispLSI 1024 Functional Block Diagram



The device also has 48 I/O cells, each of which is directly connected to an I/O pin. Each I/O cell can be individually programmed to be a combinatorial input, registered input, latched input, output or bi-directional I/O pin with 3-state control. Additionally, all outputs are polarity selectable, active high or active low. The signal levels are TTL compatible voltages and the output drivers can source 4 mA or sink 8 mA.

Eight GLBs, 16 I/O cells, two dedicated inputs and one ORP are connected together to make a Megablock (see figure 1). The outputs of the eight GLBs are connected to a set of 16 universal I/O cells by the ORP. The I/O cells within the Megablock also share a common Output Enable (OE) signal. The ispLSI 1024 device contains three of these Megablocks.

The GRP has as its inputs the outputs from all of the GLBs and all of the inputs from the bi-directional I/O cells. All of these signals are made available to the inputs of the GLBs. Delays through the GRP have been equalized to minimize timing skew.

Clocks in the ispLSI 1024 device are selected using the Clock Distribution Network. Four dedicated clock pins (Y0, Y1, Y2 and Y3) are brought into the distribution network, and five clock outputs (CLK 0, CLK 1, CLK 2, IOCLK 0 and IOCLK 1) are provided to route clocks to the GLBs and I/O cells. The Clock Distribution Network can also be driven from a special clock GLB (B4 on the ispLSI 1024 device). The logic of this GLB allows the user to create an internal clock from a combination of internal signals within the device.

Absolute Maximum Ratings [1]

Supply Voltage V_{CC} ..... -0.5 to +7.0V

Input Voltage Applied ..... -2.5 to V_{CC} +1.0V

Off-State Output Voltage Applied ..... -2.5 to V_{CC} +1.0V

Storage Temperature ..... -65 to 150°C

Case Temp. with Power Applied ..... -55 to 125°C

Max. Junction Temp. (T_J) with Power Applied ... 150°C

1. Stresses above those listed under the "Absolute Maximum Ratings" may cause permanent damage to the device. Functional operation of the device at these or at any other conditions above those indicated in the operational sections of this specification is not implied (while programming, follow the programming specifications).

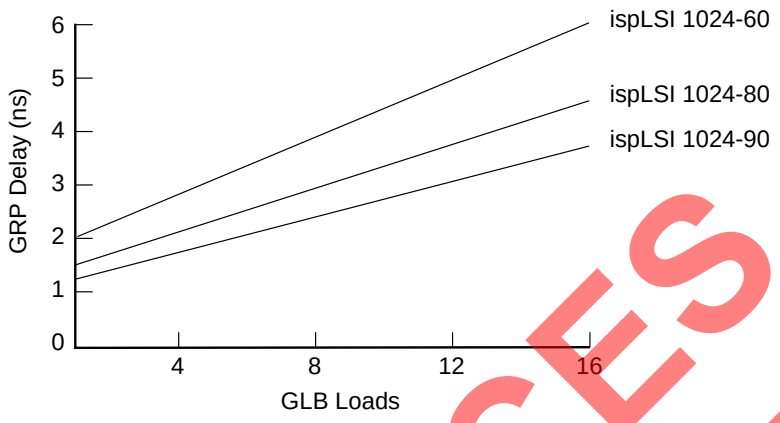
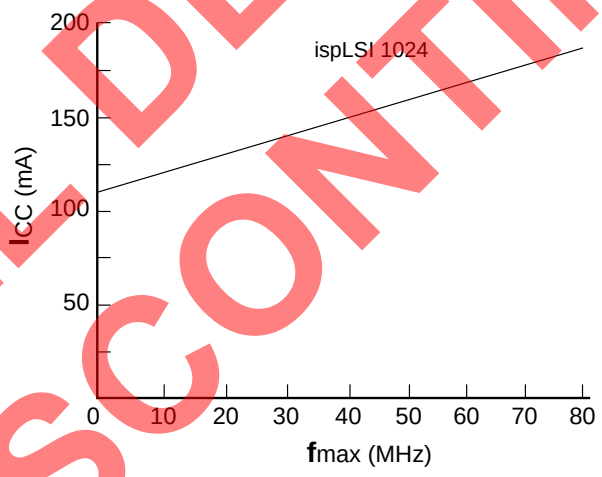
Maximum GRP Delay vs GLB Loads



Power Consumption

Power consumption in the ispLSI 1024 device depends on two primary factors: the speed at which the device is operating, and the number of Product Terms used. Figure 3 shows the relationship between power and operating speed.

Figure 3. Typical Device Power Consumption vs fmax



Notes: Configuration of Six 16-bit Counters
Typical Current at 5V, 25°C

I_{CC} can be estimated for the ispLSI 1024 using the following equation:

I_{CC} = 42 + (# of PTs * 0.45) + (# of nets * Max. freq * 0.008) where:
# of PTs = Number of Product Terms used in design
# of nets = Number of Signals used in device
Max. freq = Highest Clock Frequency to the device

The I_{CC} estimate is based on typical conditions (V_{CC} = 5.0V, room temperature) and an assumption of 2 GLB loads on average exists. These values are for estimates only. Since the value of I_{CC} is sensitive to operating conditions and the program in the device, the actual I_{CC} should be verified.

$\overline{\text{RESET}}$	20	17	Active Low (0) Reset pin which resets all of the GLB and I/O registers in the device.
Y0	16	9	Dedicated Clock input. This clock input is connected to one of the clock inputs of all of the GLBs on the device.
Y1	54	67	Dedicated Clock input. This clock input is brought into the clock distribution network, and can optionally be routed to any GLB on the device.
Y2	51	60	Dedicated Clock input. This clock input is brought into the clock distribution network, and can optionally be routed to any GLB and/or any I/O cell on the device.
Y3	50	59	Dedicated Clock input. This clock input is brought into the clock distribution network, and can optionally be routed to any I/O cell on the device.
GND	1, 18, 35, 52	14, 15, 36, 37, 61, 62, 89, 90	Ground (GND)
VCC	17, 36, 53, 68	10, 11, 40, 41, 65, 66, 85, 86	V_{CC}

Table 2 - 0002C-24

1. Pins have dual function capability.
2. NC pins are not to be connected to any active signals, Vcc or GND.
