### Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

# 1. Overview for the Arria II Device Family

AIIGX51001-4.4

The Arria® II device family is designed specifically for ease-of-use. The cost-optimized, 40-nm device family architecture features a low-power, programmable logic engine and streamlined transceivers and I/Os. Common interfaces, such as the Physical Interface for PCI Express® (PCIe®), Ethernet, and DDR3 memory are easily implemented in your design with the Quartus® II software, the SOPC Builder design software, and a broad library of hard and soft intellectual property (IP) solutions from Altera. The Arria II device family makes designing for applications requiring transceivers operating at up to 6.375 Gbps fast and easy.

This chapter contains the following sections:

- “Arria II Device Feature” on page 1–1
- “Arria II Device Architecture” on page 1–6
- “Reference and Ordering Information” on page 1–14

## Arria II Device Feature

The Arria II device features consist of the following highlights:

- 40-nm, low-power FPGA engine
  - Adaptive logic module (ALM) offers the highest logic efficiency in the industry
  - Eight-input fracturable look-up table (LUT)
  - Memory logic array blocks (MLABs) for efficient implementation of small FIFOs
- High-performance digital signal processing (DSP) blocks up to 550 MHz
  - Configurable as 9 x 9-bit, 12 x 12-bit, 18 x 18-bit, and 36 x 36-bit full-precision multipliers as well as 18 x 36-bit high-precision multiplier
  - Hardcoded adders, subtractors, accumulators, and summation functions
  - Fully-integrated design flow with the MATLAB and DSP Builder software from Altera
- Maximum system bandwidth
  - Up to 24 full-duplex clock data recovery (CDR)-based transceivers supporting rates between 600 Mbps and 6.375 Gbps
  - Dedicated circuitry to support physical layer functionality for popular serial protocols, including PCIe Gen1 and PCIe Gen2, Gbps Ethernet, Serial RapidIO® (SRIO), Common Public Radio Interface (CPRI), OBSAI, SD/HD/3G/ASI Serial Digital Interface (SDI), XAUI and Reduced XAUI (RXAUI), HiGig/HiGig+, SATA/Serial Attached SCSI (SAS), GPON, SerialLite II, Fiber Channel, SONET/SDH, Interlaken, Serial Data Converter (JESD204), and SFI-5.

---

- Complete PIPE protocol solution with an embedded hard IP block that provides physical interface and media access control (PHY/MAC) layer, Data Link layer, and Transaction layer functionality
- Optimized for high-bandwidth system interfaces
  - Up to 726 user I/O pins arranged in up to 20 modular I/O banks that support a wide range of single-ended and differential I/O standards
  - High-speed LVDS I/O support with serializer/deserializer (SERDES) and dynamic phase alignment (DPA) circuitry at data rates from 150 Mbps to 1.25 Gbps
- Low power
  - Architectural power reduction techniques
  - Typical physical medium attachment (PMA) power consumption of 100 mW at 3.125 Gbps.
  - Power optimizations integrated into the Quartus II development software
- Advanced usability and security features
  - Parallel and serial configuration options
  - On-chip series ( $R_S$ ) and on-chip parallel ( $R_T$ ) termination with auto-calibration for single-ended I/Os and on-chip differential ( $R_D$ ) termination for differential I/O
  - 256-bit advanced encryption standard (AES) programming file encryption for design security with volatile and non-volatile key storage options
  - Robust portfolio of IP for processing, serial protocols, and memory interfaces
  - Low cost, easy-to-use development kits featuring high-speed mezzanine connectors (HSMC)
- Emulated LVDS output support with a data rate of up to 1152 Mbps

Table 1–1 lists the Arria II device features.

**Table 1–1. Features in Arria II Devices**

| Feature                                            | Arria II GX Devices |              |               |            |           |           | Arria II GZ Devices |                  |                  |
|----------------------------------------------------|---------------------|--------------|---------------|------------|-----------|-----------|---------------------|------------------|------------------|

| High-Speed LVDS SERDES (up to 1.25 Gbps) (7)       | 8, 24, or 28        | 8, 24, or 28 | 24, 28, or 32 | 24, 28, 32 | 28 or 48  | 24 or 48  | 42 or 86            | 0 (8), 42, or 86 | 0 (8), 42, or 86 |

**Notes to Table 1–1:**

- (1) The total number of transceivers is divided equally between the left and right side of each device, except for the devices in the F780 package. These devices have eight transceiver channels located only on the right side of the device.
- (2) This is in four multiplier adder mode.
- (3) The FPGA fabric can use these phase locked-loops (PLLs) if they are not used by the transceiver.
- (4) The number of PLLs depends on the package. Transceiver transmitter (TX) PLL count = (number of transceiver blocks) × 2.
- (5) Banks 3C and 8C are dedicated configuration banks and do not have user I/O pins.
- (6) For Arria II GZ devices, the user I/Os count from pin-out files includes all general purpose I/O, dedicated clock pins, and dual purpose configuration pins. Transceiver pins and dedicated configuration pins are not included in the pin count.
- (7) For Arria II GZ devices, total pairs of high-speed LVDS SERDES take the lowest channel count of RX/TX. For more information, refer to the *High-Speed I/O Interfaces and DPA in Arria II Devices* chapter.
- (8) The smallest pin package (780-pin package) does not support high-speed LVDS SERDES.

Table 1–2 and Table 1–3 list the Arria II device package options and user I/O pin counts, high-speed LVDS channel counts, and transceiver channel counts for Ultra FineLine BGA (UBGA) and FineLine BGA (FBGA) devices.

**Table 1–2. Package Options and I/O Information for Arria II GX Devices** (Note 1), (2), (3), (4), (5), (6), (7)

**Notes to Table 1–2:**

- (1) The user I/O counts include clock pins.
- (2) The arrows indicate packages vertical migration capability. Vertical migration allows you to migrate to devices whose dedicated pins, configuration pins, and power pins are the same for a given package across device densities.
- (3) R<sub>D</sub> = True LVDS input buffers with on-chip differential termination (R<sub>D</sub> OCT) support.
- (4) RX = True LVDS input buffers without R<sub>D</sub> OCT support.
- (5) TX = True LVDS output buffers.
- (6) eTX = Emulated-LVDS output buffers, either LVDS\_E\_3R or LVDS\_E\_1R.
- (7) The LVDS channel count does not include dedicated clock input pins and PLL clock output pins.
- (8) These numbers represent the accumulated LVDS channels supported in Arria II GX row and column I/O banks.

**Notes to Table 1–3:**

- (1) The user I/O counts include clock pins.
- (2) RX = True LVDS input buffers without R<sub>D</sub> OCT support for row I/O banks, or true LVDS input buffers without R<sub>D</sub> OCT support for column I/O banks.
- (3) eTX = Emulated-LVDS output buffers, either LVDS\_E\_3R or LVDS\_E\_1R.
- (4) The LVDS RX and TX channels are equally divided between the left and right sides of the device.
- (5) The LVDS channel count does not include dedicated clock input pins.
- (6) For Arria II GZ 780-pin FBGA package, the LVDS channels are only supported in column I/O banks.
- (7) These numbers represents the accumulated LVDS channels supported in Arria II GZ device row and column I/O banks.

Arria II devices are available in up to four speed grades: –3 (fastest), –4, –5, and –6 (slowest). Table 1–4 lists the speed grades for Arria II devices.

## Arria II Device Architecture

Arria II devices include a customer-defined feature set optimized for cost-sensitive applications and offer a wide range of density, memory, embedded multiplier, I/O, and packaging options. Arria II devices support external memory interfaces and I/O protocols required by wireless, wireline, broadcast, computer, storage, and military markets. They inherit the 8-input ALM, M9K and M144K embedded RAM block, and high-performance DSP blocks from the Stratix® IV device family with a cost-optimized I/O cell and a transceiver optimized for 6.375 Gbps speeds.

Figure 1–1 and Figure 1–2 show an overview of the Arria II GX and Arria II GZ device architecture, respectively.

**Figure 1–1. Architecture Overview for Arria II GX Devices**

**Figure 1–2. Architecture Overview for Arria II GZ Device**

**Notes to Figure 1–2:**

- (1) Not available for 780-pin FBGA package.
- (2) Not available for 780-pin and 1152-pin FBGA packages.
- (3) The PCIe hard IP block is located on the left side of the device only (IOBANK\_QL).

## High-Speed Transceiver Features

Arria II GX devices integrate up to 16 transceivers and Arria II GZ devices up to 24 transceivers on a single device. The transceiver block is optimized for cost and power consumption. Arria II transceivers support the following features:

- Configurable pre-emphasis and equalization, and adjustable output differential voltage
- Flexible and easy-to-configure transceiver datapath to implement proprietary protocols
- Signal integrity features
  - Programmable transmitter pre-emphasis to compensate for inter-symbol interference (ISI)
  - User-controlled receiver equalization with up to 7 dB (Arria II GX) and 16 dB (Arria II GZ) of high-frequency gain
  - On-die power supply regulators for transmitter and receiver PLL charge pump and voltage-controlled oscillator (VCO) for superior noise immunity
  - Calibration circuitry for transmitter and receiver on-chip termination (OCT) resistors

- Diagnostic features
  - Serial loopback from the transmitter serializer to the receiver CDR for transceiver physical coding sublayer (PCS) and PMA diagnostics
  - Parallel loopback from the transmitter PCS to the receiver PCS with built-in self test (BIST) pattern generator and verifier
  - Reverse serial loopback pre- and post-CDR to transmitter buffer for physical link diagnostics
  - Loopback master and slave capability in PCIe hard IP blocks
  - Support for protocol features such as MSB-to-LSB transmission in a SONET/SDH configuration and spread-spectrum clocking in a PCIe configuration

Table 1–5 lists common protocols and the Arria II dedicated circuitry and features for implementing these protocols.

**Table 1–5. Sample of Supported Protocols and Feature Descriptions for Arria II Devices**

| Supported Protocols | Feature Descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

For other protocols supported by Arria II devices, such as SONET/SDH, SDI, SATA and SRIO, refer to the *Transceiver Architecture in Arria II Devices* chapter.

 PCIe Gen2 protocol is only available in Arria II GZ devices.

The following sections provide an overview of the various features of the Arria II FPGA.

## PCIe Hard IP Block

Every Arria II device includes an integrated hard IP block which implements PCIe PHY/MAC, data link, and transaction layers. This PCIe hard IP block is highly configurable to meet the requirements of the majority of PCIe applications. PCIe hard IP makes implementing PCIe Gen1 and PCIe Gen2 solution in your Arria II design simple and easy.

You can instantiate PCIe hard IP block using the PCI Compiler MegaWizard™ Plug-In Manager, similar to soft IP functions, but does not consume core FPGA resources or require placement, routing, and timing analysis to ensure correct operation of the core. Table 1-6 lists the PCIe hard IP block support for Arria II GX and GZ devices.

**Table 1-6. PCIe Hard IP Block Support**

| Support                               | Arria II GX Devices  | Arria II GZ Devices |
|---------------------------------------|----------------------|---------------------|
| PCIe Gen1                             | x1, x4, x8           | x1, x4, x8          |
| PCIe Gen2                             | —                    | x1, x4              |
| Root Port and endpoint configurations | Yes                  | Yes                 |
| Payloads                              | 128-byte to 256-byte | 128-byte to 2K-byte |

## Logic Array Block and Adaptive Logic Modules

- Logic array blocks (LABs) consists of 10 ALMs, carry chains, shared arithmetic chains, LAB control signals, local interconnect, and register chain connection lines
- ALMs expand the traditional four-input LUT architecture to eight-inputs, increasing performance by reducing logic elements (LEs), logic levels, and associated routing
- LABs have a derivative called MLAB, which adds SRAM-memory capability to the LAB
- MLAB and LAB blocks always coexist as pairs, allowing up to 50% of the logic (LABs) to be traded for memory (MLABs)

## Embedded Memory Blocks

- MLABs, M9K, and M144K embedded memory blocks provide up to 20,836 Kbits of on-chip memory capable of up to 540-MHz performance. The embedded memory structure consists of columns of embedded memory blocks that you can configure as RAM, FIFO buffers, and ROM.
- Optimized for applications such as high-throughput packet processing, high-definition (HD) line buffers for video processing functions, and embedded processor program and data storage.

- The Quartus® II software allows you to take advantage of MLABs, M9K, and M144K memory blocks by instantiating memory using a dedicated megafunction wizard or by inferring memory directly from VHDL or Verilog source code.

Table 1-7 lists the Arria II device memory modes.

**Table 1-7. Memory Modes for Arria II Devices**

| Port Mode        | Port Width Configuration                             |
|------------------|------------------------------------------------------|
| Single Port      | x1, x2, x4, x8, x9, x16, x18, x32, x36, x64, and x72 |
| Simple Dual Port | x1, x2, x4, x8, x9, x16, x18, x32, x36, x64, and x72 |
| True Dual Port   | x1, x2, x4, x8, x9, x16, x18, x32, and x36           |

## DSP Resources

- Fulfills the DSP requirements of 3G and Long Term Evolution (LTE) wireless infrastructure applications, video processing applications, and voice processing applications
- DSP block input registers efficiently implement shift registers for finite impulse response (FIR) filter applications
- The Quartus II software includes megafunctions you can use to control the mode of operation of the DSP blocks based on user-parameter settings
- You can directly infer multipliers from the VHDL or Verilog HDL source code

## I/O Features

- Contains up to 20 modular I/O banks
- All I/O banks support a wide range of single-ended and differential I/O standards listed in Table 1-8.

**Table 1-8. I/O Standards Support for Arria II Devices**

| Type             | I/O Standard                                                        |
|------------------|---------------------------------------------------------------------|
| Single-Ended I/O | LVTTL, LVCMOS, SSTL, HSTL, PCIe, and PCI-X                          |
| Differential I/O | SSTL, HSTL, LVPECL, LVDS, mini-LVDS, Bus LVDS (BLVDS) (1), and RSDS |

**Note to Table 1-8:**

(1) BLVDS is only available for Arria II GX devices.

- Supports programmable bus hold, programmable weak pull-up resistors, and programmable slew rate control
- For Arria II devices, calibrates OCT or driver impedance matching for single-ended I/O standards with one OCT calibration block on the I/O banks listed in Table 1-9.

**Table 1-9. Location of OCT Calibration Block in Arria II Devices**

| Device      | Package Option          | I/O Bank                                                                   |
|-------------|-------------------------|----------------------------------------------------------------------------|
| Arria II GX | All pin packages        | Bank 3A, Bank 7A, and Bank 8A                                              |
| Arria II GZ | 780-pin flip chip FBGA  | Bank 3A, Bank 4A, Bank 7A, and Bank 8A                                     |
|             | 1152-pin flip chip FBGA | Bank 1A, Bank 3A, Bank 4A, Bank 6A, Bank 7A, and Bank 8A                   |
|             | 1517-pin flip chip FBGA | Bank 1A, Bank 2A, Bank 3A, Bank 4A, Bank 5A, Bank 6A, Bank 7A, and Bank 8A |

- Arria II GX devices have dedicated configuration banks at Bank 3C and 8C, which support dedicated configuration pins and some of the dual-purpose pins with a configuration scheme at 1.8, 2.5, 3.0, and 3.3 V. For Arria II GZ devices, the dedicated configuration pins are located in Bank 1A and Bank 1C. However, these banks are not dedicated configuration banks; therefore, user I/O pins are available in Bank 1A and Bank 1C.
- Dedicated VCCIO, VREF, and VCCPD pin per I/O bank to allow voltage-referenced I/O standards. Each I/O bank can operate at independent VCCIO, VREF and VCCPD levels.

## High-Speed LVDS I/O and DPA

- Dedicated circuitry for implementing LVDS interfaces at speeds from 150 Mbps to 1.25 Gbps
- $R_D$  OCT for high-speed LVDS interfacing
- DPA circuitry and soft-CDR circuitry at the receiver automatically compensates for channel-to-channel and channel-to-clock skew in source-synchronous interfaces and allows for implementation of asynchronous serial interfaces with embedded clocks at up to 1.25 Gbps data rate (SGMII and GbE)
- Emulated LVDS output buffers use two single-ended output buffers with an external resistor network to support LVDS, mini-LVDS, BLVDS (only for Arria II GZ devices), and RSDS standards.

## Clock Management

- Provides dedicated global clock networks, regional clock networks, and periphery clock networks that are organized into a hierarchical structure that provides up to 192 unique clock domains
- Up to eight PLLs with 10 outputs per PLL to provide robust clock management and synthesis
  - Independently programmable PLL outputs, creating a unique and customizable clock frequency with no fixed relation to any other clock
  - Inherent jitter filtration and fine granularity control over multiply and divide ratios
  - Supports spread-spectrum input clocking and counter cascading with PLL input clock frequencies ranging from 5 to 500 MHz to support both low-cost and high-end clock performance
- FPGA fabric can use the unused transceiver PLLs to provide more flexibility

## Auto-Calibrating External Memory Interfaces

- I/O structure enhanced to provide flexible and cost-effective support for different types of memory interfaces
  - Contains features such as OCT and DQ/DQS pin groupings to enable rapid and robust implementation of different memory standards
  - An auto-calibrating megafunction is available in the Quartus II software for DDR SDRAM, DDR2 SDRAM, DDR3 SDRAM, RLDRAM II memory interface PHYs; the megafunction takes advantage of the PLL dynamic reconfiguration feature to calibrate based on the changes of process, voltage, and temperature (PVT).
- For the maximum clock rates supported in Altera's FPGA devices, refer to the External Memory Interface Spec Estimator online tool.
- For more information about the external memory interfaces support, refer to the *External Memory Interfaces in Arria II Devices* chapter.

## Nios II

- Arria II devices support all variants of the NIOS® II processor
- Nios II processors are supported by an array of software tools from Altera and leading embedded partners and are used by more designers than any other configurable processor

## Configuration Features

- Configuration
  - Supports active serial (AS), passive serial (PS), fast passive parallel (FPP), and JTAG configuration schemes.
- Design Security
  - Supports programming file encryption using 256-bit volatile and non-volatile security keys to protect designs from copying, reverse engineering, and tampering in FPP configuration mode with an external host (such as a MAX® II device or microprocessor), or when using the AS, FAS, or PS configuration scheme
  - Decrypts an encrypted configuration bitstream using the AES algorithm, an industry standard encryption algorithm that is FIPS-197 certified and requires a 256-bit security key

- Remote System Upgrade
  - Allows error-free deployment of system upgrades from a remote location securely and reliably without an external controller
  - Soft logic (either the Nios II embedded processor or user logic) implementation in the device helps download a new configuration image from a remote location, store it in configuration memory, and direct the dedicated remote system upgrade circuitry to start a reconfiguration cycle
  - Dedicated circuitry in the remote system upgrade helps to avoid system down time by performing error detection during and after the configuration process, recover from an error condition by reverting back to a safe configuration image, and provides error status information

## SEU Mitigation

- Offers built-in error detection circuitry to detect data corruption due to soft errors in the configuration random access memory (CRAM) cells
- Allows all CRAM contents to be read and verified to match a configuration-computed cyclic redundancy check (CRC) value
- You can identify and read out the bit location and the type of soft error through the JTAG or the core interface

## JTAG Boundary Scan Testing

- Supports JTAG IEEE Std. 1149.1 and IEEE Std. 1149.6 specifications
- IEEE Std. 1149.6 supports high-speed serial interface (HSSI) transceivers and performs boundary scan on alternating current (AC)-coupled transceiver channels
- Boundary-scan test (BST) architecture offers the capability to test pin connections without using physical test probes and capture functional data while a device is operating normally

## Reference and Ordering Information

Figure 1–3 shows the ordering codes for Arria II devices.

**Figure 1–3. Packaging Ordering Information for Arria II Devices**

## Document Revision History

Table 1–10 lists the revision history for this chapter.

**Table 1–10. Document Revision History (Part 1 of 2)**

| Date          | Version | Changes                                                                                                                                                                                                                                                                                                                                                                                                                                  |
