Welcome to E-XFL.COM

#### Understanding <u>Embedded - CPLDs (Complex</u> <u>Programmable Logic Devices)</u>

Embedded - CPLDs, or Complex Programmable Logic Devices, are highly versatile digital logic devices used in electronic systems. These programmable components are designed to perform complex logical operations and can be customized for specific applications. Unlike fixedfunction ICs, CPLDs offer the flexibility to reprogram their configuration, making them an ideal choice for various embedded systems. They consist of a set of logic gates and programmable interconnects, allowing designers to implement complex logic circuits without needing custom hardware.

#### **Applications of Embedded - CPLDs**

#### Details

| Product Status                  | Obsolete                                                                         |

# ispLSI° 2032/A

In-System Programmable High Density PLD

# Features

- ENHANCEMENTS
  - ispLSI 2032A is Fully Form and Function Compatible to the ispLSI 2032, with Identical Timing Specifications and Packaging
  - ispLSI 2032A is Built on an Advanced 0.35 Micron E<sup>2</sup>CMOS<sup>®</sup> Technology
- HIGH DENSITY PROGRAMMABLE LOGIC
- 1000 PLD Gates
- 32 I/O Pins, Two Dedicated Inputs
- 32 Registers
- High Speed Global Interconnect
- Wide Input Gating for Fast Counters, State Machines, Address Decoders, etc.
- Small Logic Block Size for Random Logic
- HIGH PERFORMANCE E<sup>2</sup>CMOS<sup>®</sup> TECHNOLOGY
  - fmax = 180 MHz Maximum Operating Frequency
  - tpd = 5.0 ns Propagation Delay
  - TTL Compatible Inputs and Outputs
  - Electrically Erasable and Reprogrammable
  - Non-Volatile
  - 100% Tested at Time of Manufacture
  - Unused Product Term Shutdown Saves Power
- IN-SYSTEM PROGRAMMABLE
- In-System Programmable (ISP™) 5V Only
- Increased Manufacturing Yields, Reduced Time-to-Market and Improved Product Quality
- Reprogram Soldered Devices for Faster Prototyping
- OFFERS THE EASE OF USE AND FAST SYSTEM SPEED OF PLDs WITH THE DENSITY AND FLEXIBILITY OF FIELD PROGRAMMABLE GATE ARRAYS
  - Complete Programmable Device Can Combine Glue Logic and Structured Designs
  - Enhanced Pin Locking Capability
  - Three Dedicated Clock Input Pins
  - Synchronous and Asynchronous Clocks
  - Programmable Output Slew Rate Control to Minimize Switching Noise
  - Flexible Pin Placement
  - Optimized Global Routing Pool Provides Global Interconnectivity
  - Lead-Free Package Options

# Description

The ispLSI 2032 and 2032A are High Density Programmable Logic Devices. The devices contain 32 Registers, 32 Universal I/O pins, two Dedicated Input Pins, three Dedicated Clock Input Pins, one dedicated Global OE input pin and a Global Routing Pool (GRP). The GRP provides complete interconnectivity between all of these elements. The ispLSI 2032 and 2032A feature 5V insystem programmability and in-system diagnostic capabilities. The ispLSI 2032 and 2032A offer nonvolatile reprogrammability of the logic, as well as the interconnect to provide truly reconfigurable systems.

The basic unit of logic on these devices is the Generic Logic Block (GLB). The GLBs are labeled A0, A1 .. A7 (Figure 1). There are a total of eight GLBs in the ispLSI 2032 and 2032A devices. Each GLB is made up of four macrocells. Each GLB has 18 inputs, a programmable AND/OR/Exclusive OR array, and four outputs which can be configured to be either combinatorial or registered. Inputs to the GLB come from the GRP and dedicated inputs. All of the GLB outputs are brought back into the GRP so that they can be connected to the inputs of any GLB on the device.

## **Functional Block Diagram**

The devices also have 32 I/O cells, each of which is directly connected to an I/O pin. Each I/O cell can be individually programmed to be a combinatorial input, output or bi-directional I/O pin with 3-state control. The signal levels are TTL compatible voltages and the output drivers can source 4 mA or sink 8 mA. Each output can be programmed independently for fast or slow output slew rate to minimize overall output switching noise.

Eight GLBs, 32 I/O cells, two dedicated inputs and two ORPs are connected together to make a Megablock (Figure 1). The outputs of the eight GLBs are connected to a set of 32 universal I/O cells by the ORP. Each ispLSI 2032 and 2032A device contains one Megablock.

The GRP has as its inputs, the outputs from all of the GLBs and all of the inputs from the bi-directional I/O cells.

All of these signals are made available to the inputs of the GLBs. Delays through the GRP have been equalized to minimize timing skew.

Clocks in the ispLSI 2032 and 2032A devices are selected using the dedicated clock pins. Three dedicated clock pins (Y0, Y1, Y2) or an asynchronous clock can be selected on a GLB basis. The asynchronous or Product Term clock can be generated in any GLB for its own clock.

# Absolute Maximum Ratings <sup>1</sup>

| Supply Voltage V <sub>cc</sub> 0.5 to +7.0V                    |
|----------------------------------------------------------------|
| Input Voltage Applied2.5 to V <sub>CC</sub> +1.0V              |
| Off-State Output Voltage Applied2.5 to V <sub>CC</sub> +1.0V   |
| Storage Temperature65 to 150°C                                 |
| Case Temp. with Power Applied55 to 125°C                       |
| Max. Junction Temp. (T <sub>J</sub> ) with Power Applied 150°C |

1. Stresses above those listed under the "Absolute Maximum Ratings" may cause permanent damage to the device. Functional operation of the device at these or at any other conditions above those indicated in the operational sections of this specification is not implied (while programming, follow the programming specifications).

# **DC Recommended Operating Condition**

 One output at a time for a maximum duration of one second. V<sub>OUT</sub> = 0.5V was selected to avoid test problems by tester ground degradation. Characterized but not 100% tested.

2. Measured using two 16-bit counters.

3. Typical values are at  $V_{CC}$  = 5V and  $T_A$  = 25°C.

 Maximum I<sub>CC</sub> varies widely with specific device configuration and operating frequency. Refer to the Power Consumption section of this data sheet and Thermal Management section of the Lattice Semiconductor Data Book or CD-ROM to estimate maximum I<sub>CC</sub>.

# **Over Recommended Operating Conditions**

1. Unless noted otherwise, all parameters use the GRP, 20 PTXOR path, ORP and Y0 clock.

2. Refer to Timing Model in this data sheet for further details.

3. Standard 16-bit counter using GRP feedback.

4. Reference Switching Test Conditions section.

USFISRICS

1. Unless noted otherwise, all parameters use the GRP, 20 PTXOR path, ORP and Y0 clock.

2. Refer to Timing Model in this data sheet for further details.

3. Standard 16-bit counter using GRP feedback.

4. Reference Switching Test Conditions section.

# ispLSI 2032/A Timing Model

#### Derivations of tsu, th and tco from the Product Term Clock<sup>1</sup>

tsu = Logic + Reg su - Clock (min) = (tio + tgrp + t20ptxor) + (tgsu) - (tio + tgrp + tptck(min))= (#20+ #22+ #26) + (#29) - (#20+ #22+ #35) 2.1 ns = (0.6 + 0.7 + 4.1) + (0.5) - (0.6 + 0.7 + 2.5)th = Clock (max) + Reg h - Logic = (tio + tgrp + tptck(max)) + (tgh) - (tio + tgrp + t20ptxor)= (#20+ #22+ #35) + (#30) - (#20+ #22+ #26) 1.5 ns = (0.6 + 0.7 + 3.8) + (1.8) - (0.6 + 0.7 + 4.1)tco = Clock (max) + Reg co + Output (tio + tgrp + tptck(max)) + (tgco) + (torp + tob)= (#20+ #22+ #35) + (#31) + (#36 + #38) = 7.7 ns = (0.6 + 0.7 + 3.8) + (0.7) + (0.7 + 1.2)

Note: Calculations are based upon timing specifications for the ispLSI 2032/A-180L

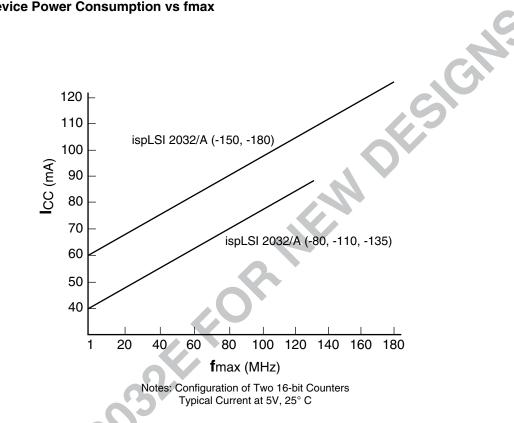

Table 2- 0042-16/2032

## **Power Consumption**

Power consumption in the ispLSI 2032 and 2032A devices depends on two primary factors: the speed at which the device is operating and the number of Product Terms used. Figure 4 shows the relationship between power and operating speed.

#### Figure 4. Typical Device Power Consumption vs fmax

ICC can be estimated for the ispLSI 2032/A using the following equation:

For 2032/A -150, -180: ICC(mA) = 30 + (# of PTs \* 0.46) + (# of nets \* Max freq \* 0.012) For 2032/A -135, -110, -80: ICC(mA) = 21 + (# of PTs \* 0.30) + (# of nets \* Max freq \* 0.012)

Where:

# of PTs = Number of Product Terms used in design

# of nets = Number of Signals used in device

Max freq = Highest Clock Frequency to the device (in MHz)

The ICC estimate is based on typical conditions (VCC = 5.0V, room temperature) and an assumption of two GLB loads on average exists. These values are for estimates only. Since the value of ICC is sensitive to operating conditions and the program in the device, the actual I<sub>CC</sub> should be verified.
