Welcome to E-XFL.COM

Embedded - System On Chip (SoC): The Heart of Modern Embedded Systems

Embedded - System On Chip (SoC) refers to an integrated circuit that consolidates all the essential components of a computer system into a single chip. This includes a microprocessor, memory, and other peripherals, all packed into one compact and efficient package. SoCs are designed to provide a complete computing solution, optimizing both space and power consumption, making them ideal for a wide range of embedded applications.

What are Embedded - System On Chip (SoC)?

System On Chip (SoC) integrates multiple functions of a computer or electronic system onto a single chip. Unlike traditional multi-chip solutions, SoCs combine a central

Details	
Product Status	Obsolete
Architecture	MCU, FPGA
Core Processor	Dual ARM® Cortex®-A9 MPCore™ with CoreSight™
Flash Size	-
RAM Size	64KB
Peripherals	DMA, POR, WDT
Connectivity	EBI/EMI, Ethernet, I²C, MMC/SD/SDIO, SPI, UART/USART, USB OTG
Speed	925MHz
Primary Attributes	FPGA - 462K Logic Elements
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	1517-BBGA, FCBGA
Supplier Device Package	1517-FBGA, FC (40x40)
Purchase URL	https://www.e-xfl.com/product-detail/intel/5asxbb5d4f40c4n

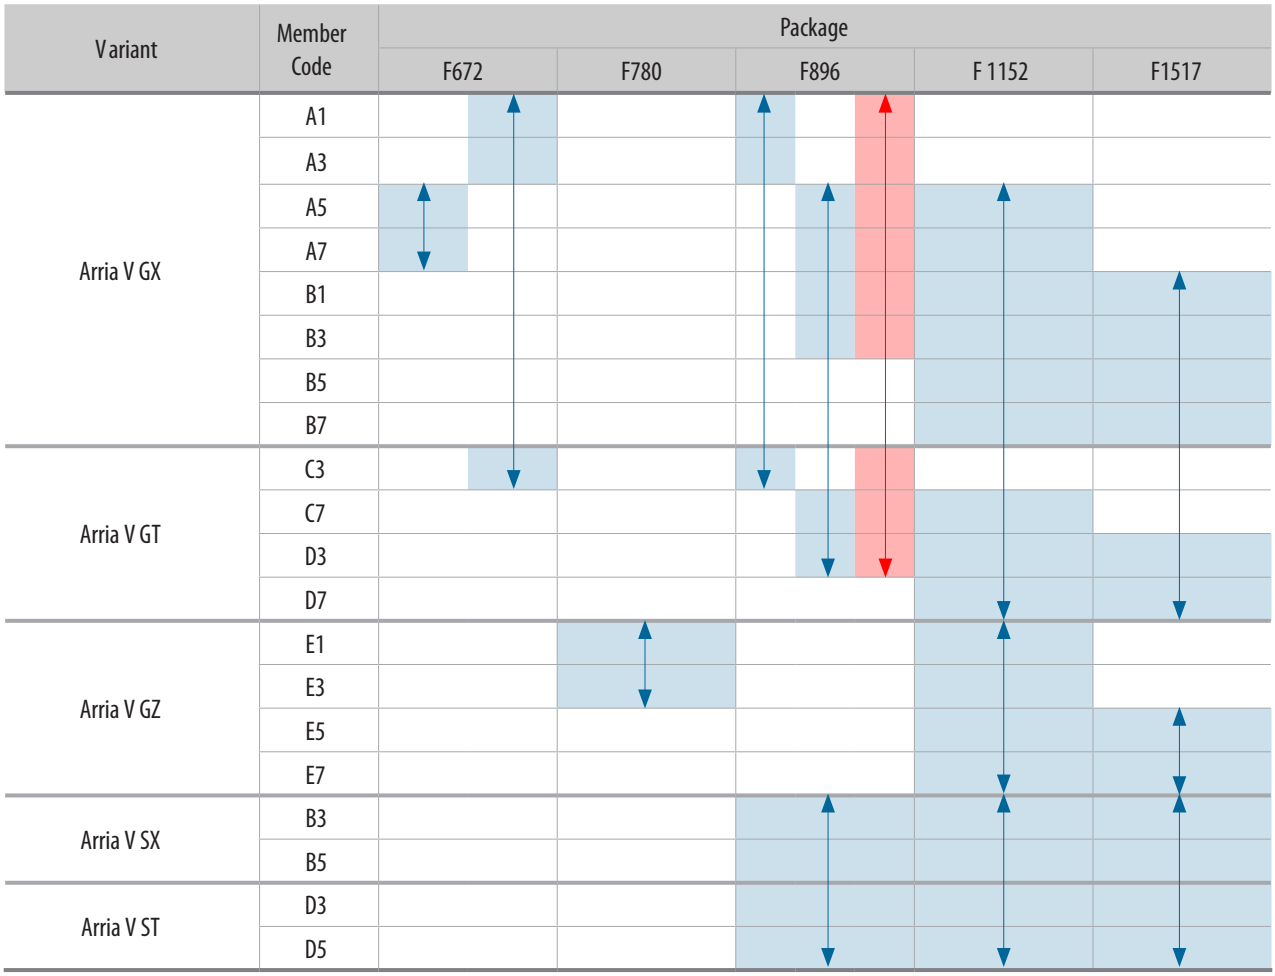
I/O Vertical Migration for Arria V Devices

Figure 6: Vertical Migration Capability Across Arria V Device Packages and Densities

The arrows indicate the vertical migration paths. Some packages have several migration paths. The devices included in each vertical migration path are shaded. You can also migrate your design across device densities in the same package option if the devices have the same dedicated pins, configuration pins, and power pins.



You can achieve the vertical migration shaded in red if you use only up to 320 GPIOs, up to nine 6 Gbps transceiver channels, and up to four 10 Gbps transceiver (for Arria V GT devices). This migration path is not shown in the Quartus Prime software Pin Migration View.

Note: To verify the pin migration compatibility, use the Pin Migration View window in the Quartus Prime software Pin Planner.

Note: Except for Arria V GX A5 and A7, and Arria V GT C7 devices, all other Arria V GX and GT devices require a specific power-up sequence. If you plan to migrate your design from Arria V GX A5 and A7, and Arria V GT C7 devices to other Arria V devices, your design must adhere to the same required power-up sequence.

Types of Embedded Memory

The Arria V devices contain two types of memory blocks:

- 20 Kb M20K or 10 Kb M10K blocks—blocks of dedicated memory resources. The M20K and M10K blocks are ideal for larger memory arrays while still providing a large number of independent ports.
- 640 bit memory logic array blocks (MLABs)—enhanced memory blocks that are configured from dual-purpose logic array blocks (LABs). The MLABs are ideal for wide and shallow memory arrays. The MLABs are optimized for implementation of shift registers for digital signal processing (DSP) applications, wide shallow FIFO buffers, and filter delay lines. Each MLAB is made up of ten adaptive logic modules (ALMs). In the Arria V devices, you can configure these ALMs as ten 32 x 2 blocks, giving you one 32 x 20 simple dual-port SRAM block per MLAB. You can also configure these ALMs, in Arria V GZ devices, as ten 64 x 1 blocks, giving you one 64 x 10 simple dual-port SRAM block per MLAB.

Embedded Memory Capacity in Arria V Devices

Embedded Memory Configurations

Table 17: Supported Embedded Memory Block Configurations for Arria V Devices

This table lists the maximum configurations supported for the embedded memory blocks. The information is applicable only to the single-port RAM and ROM modes.

Memory Block	Depth (bits)	Programmable Width
MLAB	32	x16, x18, or x20
	64(11)	x10
M20K	512	x40
	1K	x20
	2K	x10
	4K	x5
	8K	x2
	16K	x1
M10K	256	x40 or x32
	512	x20 or x16
	1K	x10 or x8
	2K	x5 or x4
	4K	x2
	8K	x1

Clock Networks and PLL Clock Sources

650 MHz Arria V devices have 16 global clock networks capable of up to operation. The clock network architecture is based on Altera's global, quadrant, and peripheral clock structure. This clock structure is supported by dedicated clock input pins and fractional PLLs.

Note: To reduce power consumption, the Quartus Prime software identifies all unused sections of the clock network and powers them down.

(11) Available for Arria V GZ devices only.

Related Information

External Memory Interface Spec Estimator
For the latest information and to estimate the external memory system performance specification, use Altera's External Memory Interface Spec Estimator tool.

Low-Power Serial Transceivers

Arria V devices deliver the industry's lowest power consumption per transceiver channel:

- 12.5 Gbps transceivers at less than 170 mW
- 10 Gbps transceivers at less than 165 mW
- 6 Gbps transceivers at less than 105 mW

Arria V transceivers are designed to be compliant with a wide range of protocols and data rates.

Transceiver Channels

The transceivers are positioned on the left and right outer edges of the device. The transceiver channels consist of the physical medium attachment (PMA), physical coding sublayer (PCS), and clock networks.

The following figures are graphical representations of a top view of the silicon die, which corresponds to a reverse view for flip chip packages. Different Arria V devices may have different floorplans than the ones shown in the figures.

Figure 9: Device Chip Overview for Arria V GX and GT Devices

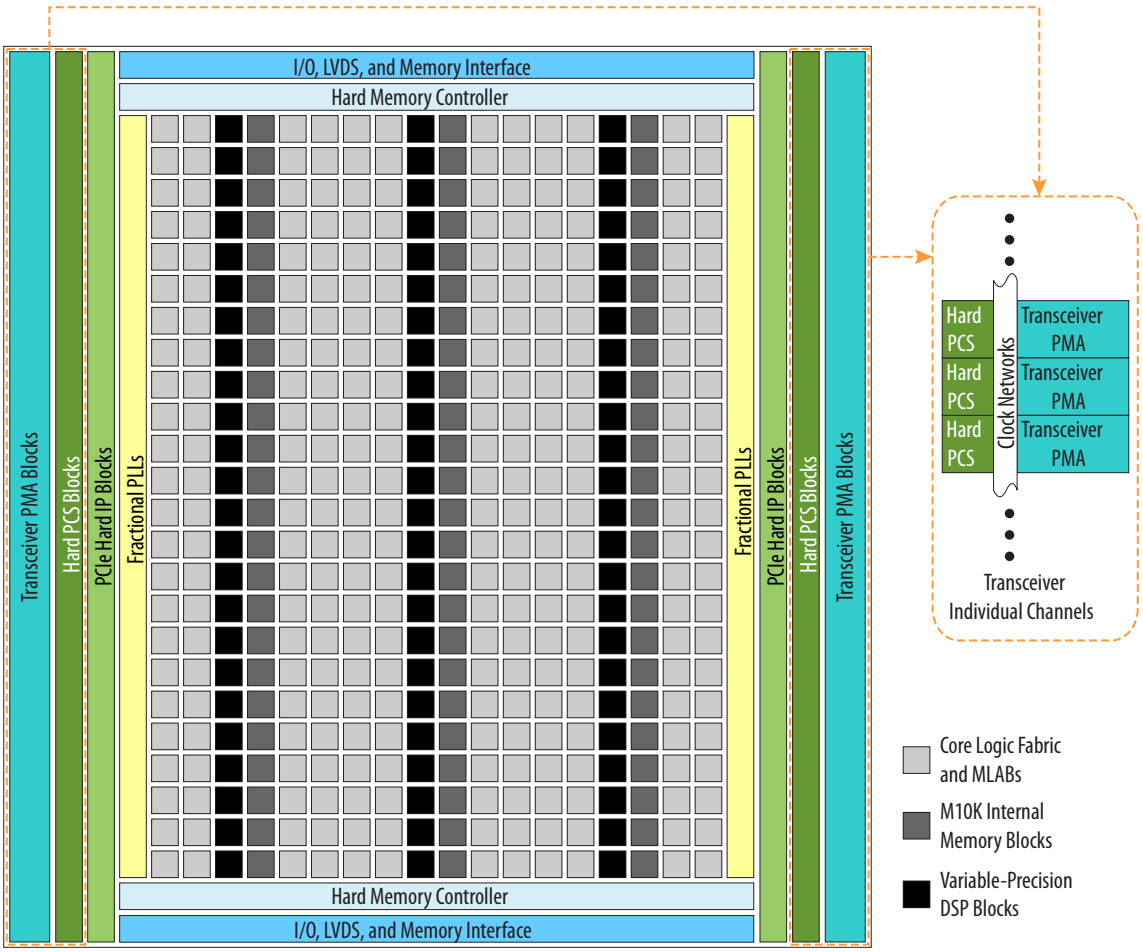

Figure 10: Device Chip Overview for Arria V GZ Devices

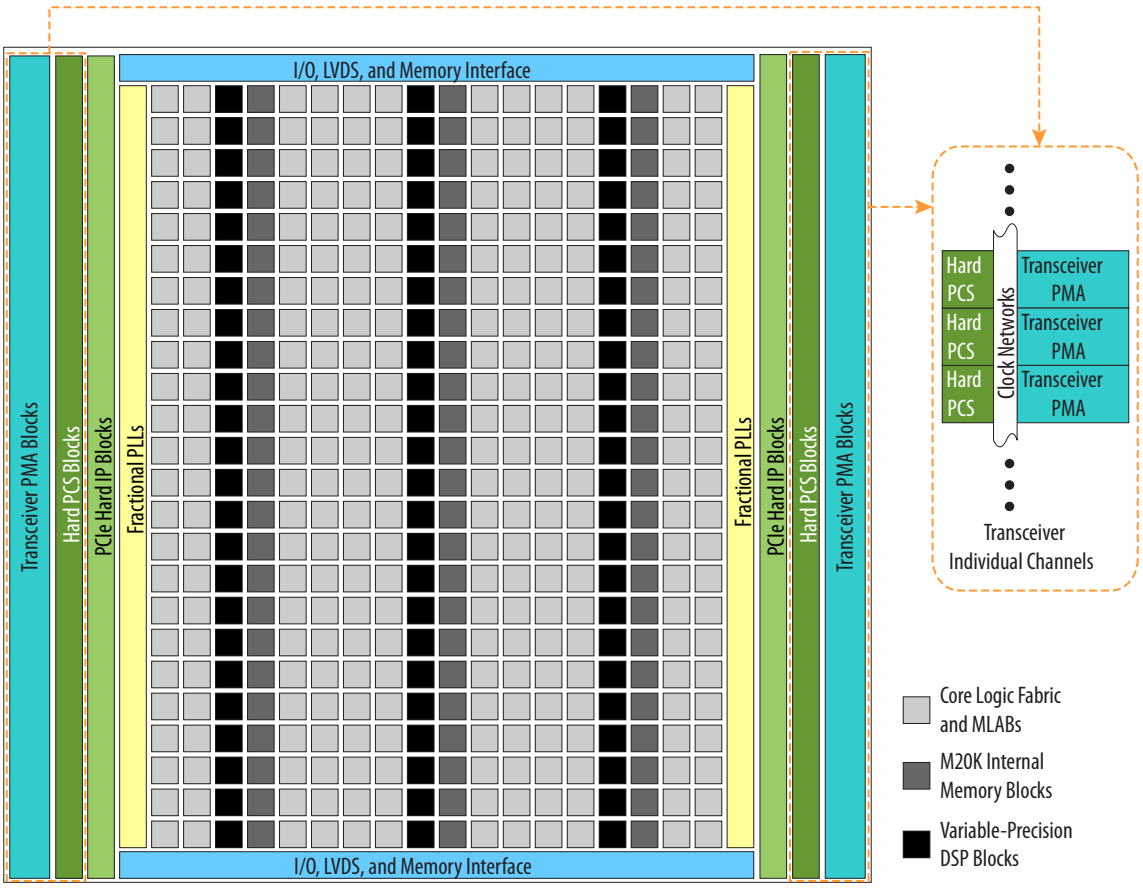


PCS Support[13]	Data Rates (Gbps)	Transmitter Data Path Feature	Receiver Data Path Feature
PCIe Gen1 (x1, x2, x4, x8)	2.5 and 5.0	• Phase compensation FIFO • Byte serializer • 8B/10B encoder • PIPE 2.0 interface to the core logic	• Word aligner • 8B/10B decoder • Byte deserializer • Phase compensation FIFO • Rate match FIFO • PIPE 2.0 interface to the core logic
PCIe Gen2[14] (x1, x2, x4)			
GbE	1.25	• Phase compensation FIFO • Byte serializer • 8B/10B encoder	• Word aligner • 8B/10B decoder • Byte deserializer • Phase compensation FIFO • Rate match FIFO
XAUI[15]	3.125	• Phase compensation FIFO • Byte serializer • 8B/10B encoder • XAUI state machine for bonding four channels	• Word aligner • 8B/10B decoder • Byte deserializer • Phase compensation FIFO • XAUI state machine for realigning four channels • Deskew FIFO circuitry
SDI	0.27[16], 1.485, 2.97	• Phase compensation FIFO • Byte serializer	• Byte deserializer • Phase compensation FIFO
GPON[17]	1.25 and 2.5		
CPRI[18]	0.6144 to 6.144	• Phase compensation FIFO • Byte serializer • 8B/10B encoder • TX deterministic latency	• Word aligner • 8B/10B decoder • Byte deserializer • Phase compensation FIFO • RX deterministic latency

(13) Data rates above 6.5536 Gbps up to 10.3125 Gbps, such as 10GBASE-R, are supported through the soft PCS.
(14) PCIe Gen2 is supported only through the PCIe hard IP.
(15) XAUI is supported through the soft PCS.
(16) The 0.27 Gbps data rate is supported using oversampling user logic that you must implement in the FPGA fabric.
(17) The GPON standard does not support burst mode.
(18) CPRI data rates above 6.5536 Gbps, such as 9.8304 Gbps, are supported through the soft PCS.

Table 22: Transceiver PCS Features for Arria V GZ Devices

Protocol	Data Rates (Gbps)	Transmitter Data Path Features	Receiver Data Path Features
Custom PHY	0.6 to 9.80	• Phase compensation FIFO • Byte serializer • 8B/10B encoder • Bit-slip • Channel bonding	• Word aligner • Deskew FIFO • Rate match FIFO • 8B/10B decoder • Byte deserializer • Byte ordering
GPON	1.25 and 2.5		
Custom 10G PHY	9.98 to 12.5	• TX FIFO • Gear box • Bit-slip	• RX FIFO • Gear box
PCIe Gen1 (x1, x2 x4, x8)	2.5 and 5.0	• Phase compensation FIFO • Byte serializer • 8B/10B encoder • Bit-slip • Channel bonding • PIPE 2.0 interface to core logic	• Word aligner • Deskew FIFO • Rate match FIFO • 8B/10B decoder • Byte deserializer, • Byte ordering • PIPE 2.0 interface to core logic
PCIe Gen2 (x1, x2, x4, x8)			
PCIe Gen3 (x1, x2, x4, x8)	8.0	• Phase compensation FIFO • 128B/130B encoder • Scrambler • Gear box • Bit-slip	• Block synchronization • Rate match FIFO • 128B/130B decoder • Descrambler • Phase compensation FIFO
10GbE	10.3125	• TX FIFO • 64B/66B encoder • Scrambler • Gear box	• RX FIFO • 64B/66B decoder • Descrambler • Block synchronization • Gear box
Interlaken	3.125 to 12.5	• TX FIFO • Frame generator • CRC-32 generator • Scrambler • Disparity generator • Gear box	• RX FIFO • Frame generator • CRC-32 checker • Frame decoder • Descrambler • Disparity checker • Block synchronization • Gear box

SoC with HPS

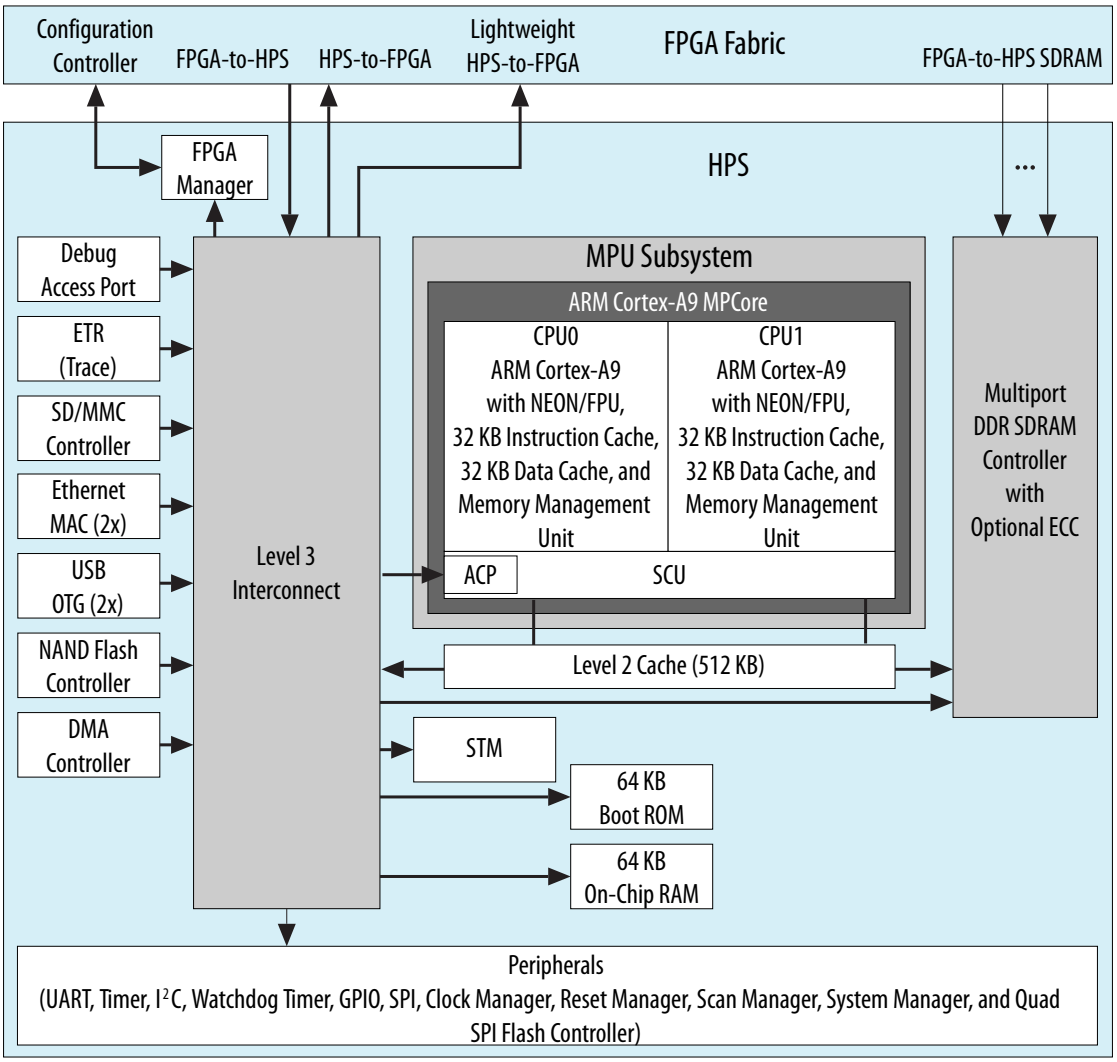
Each SoC combines an FPGA fabric and an HPS in a single device. This combination delivers the flexibility of programmable logic with the power and cost savings of hard IP in these ways:

- Reduces board space, system power, and bill of materials cost by eliminating a discrete embedded processor
- Allows you to differentiate the end product in both hardware and software, and to support virtually any interface standard
- Extends the product life and revenue through in-field hardware and software updates

HPS Features

The HPS consists of a dual-core ARM Cortex-A9 MPCore processor, a rich set of peripherals, and a shared multiport SDRAM memory controller, as shown in the following figure.

Figure 12: HPS with Dual-Core ARM Cortex-A9 MPCore Processor



System Peripherals and Debug Access Port

Each Ethernet MAC, USB OTG, NAND flash controller, and SD/MMC controller module has an integrated DMA controller. For modules without an integrated DMA controller, an additional DMA controller module provides up to eight channels of high-bandwidth data transfers. Peripherals that communicate off-chip are multiplexed with other peripherals at the HPS pin level. This allows you to choose which peripherals to interface with other devices on your PCB.

The debug access port provides interfaces to industry standard JTAG debug probes and supports ARM CoreSight debug and core traces to facilitate software development.

HPS–FPGA AXI Bridges

The HPS–FPGA bridges, which support the Advanced Microcontroller Bus Architecture (AMBA®) Advanced eXtensible Interface (AXI™) specifications, consist of the following bridges:

- FPGA-to-HPS AXI bridge—a high-performance bus supporting 32, 64, and 128 bit data widths that allows the FPGA fabric to issue transactions to slaves in the HPS.
- HPS-to-FPGA AXI bridge—a high-performance bus supporting 32, 64, and 128 bit data widths that allows the HPS to issue transactions to slaves in the FPGA fabric.
- Lightweight HPS-to-FPGA AXI bridge—a lower latency 32 bit width bus that allows the HPS to issue transactions to slaves in the FPGA fabric. This bridge is primarily used for control and status register (CSR) accesses to peripherals in the FPGA fabric.

The HPS–FPGA AXI bridges allow masters in the FPGA fabric to communicate with slaves in the HPS logic, and vice versa. For example, the HPS-to-FPGA AXI bridge allows you to share memories instantiated in the FPGA fabric with one or both microprocessors in the HPS, while the FPGA-to-HPS AXI bridge allows logic in the FPGA fabric to access the memory and peripherals in the HPS.

Each HPS–FPGA bridge also provides asynchronous clock crossing for data transferred between the FPGA fabric and the HPS.

HPS SDRAM Controller Subsystem

The HPS SDRAM controller subsystem contains a multiport SDRAM controller and DDR PHY that are shared between the FPGA fabric (through the FPGA-to-HPS SDRAM interface), the level 2 (L2) cache, and the level 3 (L3) system interconnect. The FPGA-to-HPS SDRAM interface supports AMBA AXI and Avalon® Memory-Mapped (Avalon-MM) interface standards, and provides up to six individual ports for access by masters implemented in the FPGA fabric.

To maximize memory performance, the SDRAM controller subsystem supports command and data reordering, deficit round-robin arbitration with aging, and high-priority bypass features. The SDRAM controller subsystem supports DDR2, DDR3, or LPDDR2 devices up to 4 Gb in density operating at up to 533 MHz (1066 Mbps data rate).

FPGA Configuration and Processor Booting

The FPGA fabric and HPS in the SoC are powered independently. You can reduce the clock frequencies or gate the clocks to reduce dynamic power, or shut down the entire FPGA fabric to reduce total system power.

Partial Reconfiguration

Note: Partial reconfiguration is an advanced feature of the device family. If you are interested in using partial reconfiguration, contact Altera for support.

Partial reconfiguration allows you to reconfigure part of the device while other sections of the device remain operational. This capability is important in systems with critical uptime requirements because it allows you to make updates or adjust functionality without disrupting services.

Apart from lowering cost and power consumption, partial reconfiguration increases the effective logic density of the device because placing device functions that do not operate simultaneously is not necessary. Instead, you can store these functions in external memory and load them whenever the functions are required. This capability reduces the size of the device because it allows multiple applications on a single device—saving the board space and reducing the power consumption.

Altera simplifies the time-intensive task of partial reconfiguration by building this capability on top of the proven incremental compile and design flow in the Quartus Prime design software. With the Altera solution, you do not need to know all the intricate device architecture details to perform a partial reconfiguration.

Partial reconfiguration is supported through the FPP x16 configuration interface. You can seamlessly use partial reconfiguration in tandem with dynamic reconfiguration to enable simultaneous partial reconfiguration of both the device core and transceivers.

Enhanced Configuration and Configuration via Protocol

Table 23: Configuration Modes and Features of Arria V Devices

Arria V devices support 1.8 V, 2.5 V, 3.0 V, and 3.3 V[19] programming voltages and several configuration modes.

Mode	Data Width	Max Clock Rate (MHz)	Max Data Rate (Mbps)	Decompressio	Design Security	Partial Reconfiguratio[20]	Remote System Update
AS through the EPCS and EPCQ serial configuration device	1 bit, 4 bits	100	—	Yes	Yes	—	Yes
PS through CPLD or external microcontroller	1 bit	125	125	Yes	Yes	—	—

[19] Arria V GZ does not support 3.3 V.
[20] Partial reconfiguration is an advanced feature of the device family. If you are interested in using partial reconfiguration, contact Altera for support.

Date	Version	Changes
July 2012	2.1	• Added –I3 speed grade to Figure 1 for Arria V GX devices. • Updated the 6-Gbps transceiver speed from 6.553 Gbps to 6.5536 Gbps in Figure 3 and Figure 1.
June 2012	2.0	• Restructured the document. • Added the "Embedded Memory Capacity" and "Embedded Memory Configurations" sections. • Added Table 1, Table 3, Table 12, Table 15, and Table 16. • Updated Table 2, Table 4, Table 5, Table 6, Table 7, Table 8, Table 9, Table 10, Table 11, Table 13, Table 14, and Table 19. • Updated Figure 1, Figure 2, Figure 3, Figure 4, and Figure 8. • Updated the "FPGA Configuration and Processor Booting" and "Hardware and Software Development" sections. • Text edits throughout the document.
February 2012	1.3	• Updated Table 1–7 and Table 1–8. • Updated Figure 1–9 and Figure 1–10. • Minor text edits.
December 2011	1.2	Minor text edits.
November 2011	1.1	• Updated Table 1–1, Table 1–2, Table 1–3, Table 1–4, Table 1–6, Table 1–7, Table 1–9, and Table 1–10. • Added "SoC FPGA with HPS" section. • Updated "Clock Networks and PLL Clock Sources" and "Ordering Information" sections. • Updated Figure 1–5. • Added Figure 1–6. • Minor text edits.
August 2011	1.0	Initial release.
