Welcome to E-XFL.COM

Embedded - System On Chip (SoC): The Heart of Modern Embedded Systems

Embedded - System On Chip (SoC) refers to an integrated circuit that consolidates all the essential components of a computer system into a single chip. This includes a microprocessor, memory, and other peripherals, all packed into one compact and efficient package. SoCs are designed to provide a complete computing solution, optimizing both space and power consumption, making them ideal for a wide range of embedded applications.

What are Embedded - System On Chip (SoC)?

System On Chip (SoC) integrates multiple functions of a computer or electronic system onto a single chip. Unlike traditional multi-chip solutions, SoCs combine a central

Details	
Product Status	Obsolete
Architecture	MCU, FPGA
Core Processor	Dual ARM® Cortex®-A9 MPCore™ with CoreSight™
Flash Size	-
RAM Size	64KB
Peripherals	DMA, POR, WDT
Connectivity	EBI/EMI, Ethernet, I²C, MMC/SD/SDIO, SPI, UART/USART, USB OTG
Speed	800MHz
Primary Attributes	FPGA - 462K Logic Elements
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	1517-BBGA, FCBGA
Supplier Device Package	1517-FBGA, FC (40x40)
Purchase URL	https://www.e-xfl.com/product-detail/intel/5asxbb5d4f40i5n

Feature	Description

Embedded Hard IP blocks	**Variable-precision DSP**
	 • Native support for up to four signal processing precision levels:
	  • Three 9 x 9, two 18 x 18, or one 27 x 27 multiplier in the same variable-precision DSP block
	  • One 36 x 36 multiplier using two variable-precision DSP blocks (Arria V GZ devices only)
	 • 64-bit accumulator and cascade for systolic finite impulse responses (FIRs)
	 • Embedded internal coefficient memory
	 • Preadder/subtractor for improved efficiency

	Memory controller (Arria V GX, GT, SX, and ST only) DDR3 and DDR2

	Embedded transceiver I/O
	 • Custom implementation:
	  • Arria V GX and SX devices—up to 6.5536 Gbps
	  • Arria V GT and ST devices—up to 10.3125 Gbps
	  • Arria V GZ devices—up to 12.5 Gbps
	 • PCI Express® (PCIe®) Gen2 (x1, x2, or x4) and Gen1 (x1, x2, x4, or x8) hard IP with multifunction support, endpoint, and root port
	 • PCIe Gen3 (x1, x2, x4, or x8) support (Arria V GZ only)
	 • Gbps Ethernet (GbE) and XAUI physical coding sublayer (PCS)
	 • Common Public Radio Interface (CPRI) PCS
	 • Gigabit-capable passive optical network (GPON) PCS
	 • 10-Gbps Ethernet (10GbE) PCS (Arria V GZ only)
	 • Serial RapidIO® (SRIO) PCS
	 • Interlaken PCS (Arria V GZ only)

Clock networks	• Up to 650 MHz global clock network • Global, quadrant, and peripheral clock networks • Clock networks that are not used can be powered down to reduce dynamic power
Phase-locked loops (PLLs)	• High-resolution fractional PLLs • Precision clock synthesis, clock delay compensation, and zero delay buffering (ZDB) • Integer mode and fractional mode • LC oscillator ATX transmitter PLLs (Arria V GZ only)

Feature	Description
FPGA General-purpose I/Os (GPIOs)	• 1.6 Gbps LVDS receiver and transmitter • 800 MHz/1.6 Gbps external memory interface • On-chip termination (OCT) • 3.3 V support [2]
External Memory Interface	Memory interfaces with low latency: • Hard memory controller-up to 1.066 Gbps • Soft memory controller-up to 1.6 Gbps
Low-power high-speed serial interface	• 600 Mbps to 12.5 Gbps integrated transceiver speed • Less than 105 mW per channel at 6 Gbps, less than 165 mW per channel at 10 Gbps, and less than 170 mW per channel at 12.5 Gbps • Transmit pre-emphasis and receiver equalization • Dynamic partial reconfiguration of individual channels • Physical medium attachment (PMA) with soft PCS that supports 9.8304 Gbps CPRI (Arria V GT and ST only) • PMA with hard PCS that supports up to 9.8 Gbps CPRI (Arria V GZ only) • Hard PCS that supports 10GBASE-R and 10GBASE-KR (Arria V GZ only)
HPS (Arria V SX and ST devices only)	• Dual-core ARM Cortex-A9 MPCore processor—up to 1.05 GHz maximum frequency with support for symmetric and asymmetric multiprocessing • Interface peripherals—10/100/1000 Ethernet media access control (EMAC), USB 2.0 On-The-GO (OTG) controller, quad serial peripheral interface (QSPI) flash controller, NAND flash controller, Secure Digital/MultiMediaCard (SD/MMC) controller, UART, serial peripheral interface (SPI), I2C interface, and up to 85 HPS GPIO interfaces • System peripherals—general-purpose timers, watchdog timers, direct memory access (DMA) controller, FPGA configuration manager, and clock and reset managers • On-chip RAM and boot ROM • HPS–FPGA bridges—include the FPGA-to-HPS, HPS-to-FPGA, and lightweight HPS-to-FPGA bridges that allow the FPGA fabric to issue transactions to slaves in the HPS, and vice versa • FPGA-to-HPS SDRAM controller subsystem—provides a configurable interface to the multiport front end (MPFE) of the HPS SDRAM controller • ARM CoreSight™ JTAG debug access port, trace port, and on-chip trace storage

(9) Chip-to-chip connections only. For 10 Gbps channel usage conditions, refer to the Transceiver Architecture in Arria V Devices chapter.

(10) The number of GPIOs does not include transceiver I/Os. In the Quartus Prime software, the number of user I/Os includes transceiver I/Os.

I/O Vertical Migration for Arria V Devices

Figure 6: Vertical Migration Capability Across Arria V Device Packages and Densities

The arrows indicate the vertical migration paths. Some packages have several migration paths. The devices included in each vertical migration path are shaded. You can also migrate your design across device densities in the same package option if the devices have the same dedicated pins, configuration pins, and power pins.

You can achieve the vertical migration shaded in red if you use only up to 320 GPIOs, up to nine 6 Gbps transceiver channels, and up to four 10 Gbps transceiver (for Arria V GT devices). This migration path is not shown in the Quartus Prime software Pin Migration View.

Note: To verify the pin migration compatibility, use the Pin Migration View window in the Quartus Prime software Pin Planner.

Note: Except for Arria V GX A5 and A7, and Arria V GT C7 devices, all other Arria V GX and GT devices require a specific power-up sequence. If you plan to migrate your design from Arria V GX A5 and A7, and Arria V GT C7 devices to other Arria V devices, your design must adhere to the same required power-up sequence.
Related Information

- **Power Management in Arria V Devices**
  Describes the power-up sequence required for Arria V GX and GT devices.

Adaptive Logic Module

Arria V devices use a 28 nm ALM as the basic building block of the logic fabric.

The ALM, as shown in following figure, uses an 8-input fracturable look-up table (LUT) with four dedicated registers to help improve timing closure in register-rich designs and achieve an even higher design packing capability than previous generations.

Figure 7: ALM for Arria V Devices

You can configure up to 50% of the ALMs in the Arria V devices as distributed memory using MLABs.

Lists the embedded memory capacity for each device.

Variable-Precision DSP Block

Arria V devices feature a variable-precision DSP block that supports these features:

- Configurable to support signal processing precisions ranging from 9 x 9, 18 x 18, 27 x 27, and 36 x 36 bits natively
- A 64-bit accumulator
- Double accumulator
- A hard preadder that is available in both 18- and 27-bit modes
- Cascaded output adders for efficient systolic finite impulse response (FIR) filters
- Dynamic coefficients
- 18-bit internal coefficient register banks
- Enhanced independent multiplier operation
- Efficient support for single-precision floating point arithmetic
- The inferability of all modes by the Quartus Prime design software

Table 14: Variable-Precision DSP Block Configurations for Arria V Devices

Usage Example	Multiplier Size (Bit)	DSP Block Resource
Low precision fixed point for video applications	Three 9 x 9	1
Medium precision fixed point in FIR filters	Two 18 x 18	1
FIR filters	Two 18 x 18 with accumulate	1
Single-precision floating-point implementations	One 27 x 27	1
Very high precision fixed point implementations	One 36 x 36	2

You can configure each DSP block during compilation as independent three 9 x 9, two 18 x 18, or one 27 x 27 multipliers. Using two DSP block resources, you can also configure a 36 x 36 multiplier for high-precision applications. With a dedicated 64 bit cascade bus, you can cascade multiple variable-precision DSP blocks to implement even higher precision DSP functions efficiently.

| Variant | Member Code | M20K | | M10K | | MLAB | | Total RAM Bit (Kb) |
		Block	RAM Bit (Kb)	Block	RAM Bit (Kb)	Block	RAM Bit (Kb)	
Arria V ST	D3	—	—	1,729	17,290	3223	2,014	19,304
	D5	—	—	2,282	22,820	4253	2,658	25,478

Embedded Memory Configurations

Table 17: Supported Embedded Memory Block Configurations for Arria V Devices

This table lists the maximum configurations supported for the embedded memory blocks. The information is applicable only to the single-port RAM and ROM modes.

Memory Block	Depth (bits)	Programmable Width
MLAB	32	x16, x18, or x20
	64[11]	x10
M20K	512	x40
	1K	x20
	2K	x10
	4K	x5
	8K	x2
	16K	x1
M10K	256	x40 or x32
	512	x20 or x16
	1K	x10 or x8
	2K	x5 or x4
	4K	x2
	8K	x1

Clock Networks and PLL Clock Sources

650 MHz Arria V devices have 16 global clock networks capable of up to operation. The clock network architecture is based on Altera's global, quadrant, and peripheral clock structure. This clock structure is supported by dedicated clock input pins and fractional PLLs.

Note: To reduce power consumption, the Quartus Prime software identifies all unused sections of the clock network and powers them down.

[11] Available for Arria V GZ devices only.

PLL Features

The PLLs in the Arria V devices support the following features:

- Frequency synthesis
- On-chip clock deskew
- Jitter attenuation
- Counter reconfiguration
- Programmable output clock duty cycles
- PLL cascading
- Reference clock switchover
- Programmable bandwidth
- Dynamic phase shift
- Zero delay buffers

Fractional PLL

In addition to integer PLLs, the Arria V devices use a fractional PLL architecture. The devices have up to 16 PLLs, each with 18 output counters. One fractional PLL can use up to 18 output counters and two adjacent fractional PLLs share the 18 output counters. You can use the output counters to reduce PLL usage in two ways:

- Reduce the number of oscillators that are required on your board by using fractional PLLs
- Reduce the number of clock pins that are used in the device by synthesizing multiple clock frequencies from a single reference clock source

If you use the fractional PLL mode, you can use the PLLs for precision fractional-N frequency synthesis— removing the need for off-chip reference clock sources in your design.

The transceiver fractional PLLs that are not used by the transceiver I/Os can be used as general purpose fractional PLLs by the FPGA fabric.

FPGA General Purpose I/O

Arria V devices offer highly configurable GPIOs. The following list describes the features of the GPIOs:

- Programmable bus hold and weak pull-up
- LVDS output buffer with programmable differential output voltage (V_{OD}) and programmable pre-emphasis
- On-chip parallel termination (R_T OCT) for all I/O banks with OCT calibration to limit the termination impedance variation
- On-chip dynamic termination that has the ability to swap between series and parallel termination, depending on whether there is read or write on a common bus for signal integrity
- Unused voltage reference (VREF) pins that can be configured as user I/Os (Arria V GX, GT, SX, and ST only)
- Easy timing closure support using the hard read FIFO in the input register path, and delay-locked loop (DLL) delay chain with fine and coarse architecture

PCIe Gen1, Gen2, and Gen 3 Hard IP

Arria V devices contain PCIe hard IP that is designed for performance and ease-of-use. The PCIe hard IP consists of the MAC, data link, and transaction layers.

The PCIe hard IP supports PCIe Gen3, Gen 2, and Gen 1 end point and root port for up to x8 lane configuration.

The PCIe endpoint support includes multifunction support for up to eight functions, as shown in the following figure. The integrated multifunction support reduces the FPGA logic requirements by up to 20,000 LEs for PCIe designs that require multiple peripherals.

Figure 8: PCIe Multifunction for Arria V Devices
The Arria V PCIe hard IP operates independently from the core logic. This independent operation allows the PCIe link to wake up and complete link training in less than 100 ms while the Arria V device completes loading the programming file for the rest of the device.

In addition, the PCIe hard IP in the Arria V device provides improved end-to-end datapath protection using ECC.

External Memory Interface

This section provides an overview of the external memory interface in Arria V devices.

Hard and Soft Memory Controllers

Arria V GX,GT, SX, and ST devices support up to four hard memory controllers for DDR3 and DDR2 SDRAM devices. Each controller supports 8 to 32 bit components of up to 4 gigabits (Gb) in density with two chip selects and optional ECC. For the Arria V SoC devices, an additional hard memory controller in the HPS supports DDR3, DDR2, and LPDDR2 SDRAM devices.

All Arria V devices support soft memory controllers for DDR3, DDR2, and LPDDR2 SDRAM devices, QDR II+, QDR II, and DDR II+ SRAM devices, and RLDRAM II devices for maximum flexibility.

Note: DDR3 SDRAM leveling is supported only in Arria V GZ devices.

External Memory Performance

Table 18: External Memory Interface Performance in Arria V Devices

Interface	Voltage (V)	Hard Controller (MHz)	Soft Controller (MHz)	
		Arria V GX, GT, SX, and ST	Arria V GX, GT, SX, and ST	Arria V GZ
DDR3 SDRAM	1.5	533	667	800
	1.35	533	600	800
DDR2 SDRAM	1.8	400	400	400
LPDDR2 SDRAM	1.2	—	400	—
RLDRAM 3	1.2	—	—	667
RLDRAM II	1.8	—	400	533
	1.5	—	400	533
QDR II+ SRAM	1.8	—	400	500
	1.5	—	400	500
QDR II SRAM	1.8	—	400	333
	1.5	—	400	333

Low-Power Serial Transceivers

Arria V devices deliver the industry's lowest power consumption per transceiver channel:

- 12.5 Gbps transceivers at less than 170 mW
- 10 Gbps transceivers at less than 165 mW
- 6 Gbps transceivers at less than 105 mW

Arria V transceivers are designed to be compliant with a wide range of protocols and data rates.

Transceiver Channels

The transceivers are positioned on the left and right outer edges of the device. The transceiver channels consist of the physical medium attachment (PMA), physical coding sublayer (PCS), and clock networks.

The following figures are graphical representations of a top view of the silicon die, which corresponds to a reverse view for flip chip packages. Different Arria V devices may have different floorplans than the ones shown in the figures.

**Figure 10: Device Chip Overview for Arria V GZ Devices**

Figure 11: Device Chip Overview for Arria V SX and ST Devices

PMA Features

To prevent core and I/O noise from coupling into the transceivers, the PMA block is isolated from the rest of the chip—ensuring optimal signal integrity. For the transceivers, you can use the channel PLL of an unused receiver PMA as an additional transmit PLL.

Table 20: PMA Features of the Transceivers in Arria V Devices

Features	Capability
Backplane support	• Arria V GX, GT, SX, and ST devices—Driving capability at 6.5536 Gbps with up to 25 dB channel loss • Arria V GZ devices—Driving capability at 12.5 Gbps with up to 16 dB channel loss
Chip-to-chip support	• Arria V GX, GT, SX, and ST devices—Up to 10.3125 Gbps • Arria V GZ devices—Up to 12.5 Gbps

PCS Support[13]	Data Rates (Gbps)	Transmitter Data Path Feature	Receiver Data Path Feature
PCIe Gen1 (x1, x2, x4, x8) PCIe Gen2[14] (x1, x2, x4)	2.5 and 5.0	• Phase compensation FIFO • Byte serializer • 8B/10B encoder • PIPE 2.0 interface to the core logic	• Word aligner • 8B/10B decoder • Byte deserializer • Phase compensation FIFO • Rate match FIFO • PIPE 2.0 interface to the core logic
GbE	1.25	• Phase compensation FIFO • Byte serializer • 8B/10B encoder	• Word aligner • 8B/10B decoder • Byte deserializer • Phase compensation FIFO • Rate match FIFO
XAUI[15]	3.125	• Phase compensation FIFO • Byte serializer • 8B/10B encoder • XAUI state machine for bonding four channels	• Word aligner • 8B/10B decoder • Byte deserializer • Phase compensation FIFO • XAUI state machine for realigning four channels • Deskew FIFO circuitry
SDI GPON[17]	0.27[16], 1.485, 2.97 1.25 and 2.5	• Phase compensation FIFO • Byte serializer	• Byte deserializer • Phase compensation FIFO
CPRI[18]	0.6144 to 6.144	• Phase compensation FIFO • Byte serializer • 8B/10B encoder • TX deterministic latency	• Word aligner • 8B/10B decoder • Byte deserializer • Phase compensation FIFO • RX deterministic latency

[13] Data rates above 6.5536 Gbps up to 10.3125 Gbps, such as 10GBASE-R, are supported through the soft PCS.
[14] PCIe Gen2 is supported only through the PCIe hard IP.
[15] XAUI is supported through the soft PCS.
[16] The 0.27 Gbps data rate is supported using oversampling user logic that you must implement in the FPGA fabric.
[17] The GPON standard does not support burst mode.
[18] CPRI data rates above 6.5536 Gbps, such as 9.8304 Gbps, are supported through the soft PCS.

System Peripherals and Debug Access Port

Each Ethernet MAC, USB OTG, NAND flash controller, and SD/MMC controller module has an integrated DMA controller. For modules without an integrated DMA controller, an additional DMA controller module provides up to eight channels of high-bandwidth data transfers. Peripherals that communicate off-chip are multiplexed with other peripherals at the HPS pin level. This allows you to choose which peripherals to interface with other devices on your PCB.

The debug access port provides interfaces to industry standard JTAG debug probes and supports ARM CoreSight debug and core traces to facilitate software development.

HPS–FPGA AXI Bridges

The HPS–FPGA bridges, which support the Advanced Microcontroller Bus Architecture (AMBA®) Advanced eXtensible Interface (AXI™) specifications, consist of the following bridges:

- FPGA-to-HPS AXI bridge—a high-performance bus supporting 32, 64, and 128 bit data widths that allows the FPGA fabric to issue transactions to slaves in the HPS.
- HPS-to-FPGA AXI bridge—a high-performance bus supporting 32, 64, and 128 bit data widths that allows the HPS to issue transactions to slaves in the FPGA fabric.
- Lightweight HPS-to-FPGA AXI bridge—a lower latency 32 bit width bus that allows the HPS to issue transactions to slaves in the FPGA fabric. This bridge is primarily used for control and status register (CSR) accesses to peripherals in the FPGA fabric.

The HPS–FPGA AXI bridges allow masters in the FPGA fabric to communicate with slaves in the HPS logic, and vice versa. For example, the HPS-to-FPGA AXI bridge allows you to share memories instantiated in the FPGA fabric with one or both microprocessors in the HPS, while the FPGA-to-HPS AXI bridge allows logic in the FPGA fabric to access the memory and peripherals in the HPS.

Each HPS–FPGA bridge also provides asynchronous clock crossing for data transferred between the FPGA fabric and the HPS.

HPS SDRAM Controller Subsystem

The HPS SDRAM controller subsystem contains a multiport SDRAM controller and DDR PHY that are shared between the FPGA fabric (through the FPGA-to-HPS SDRAM interface), the level 2 (L2) cache, and the level 3 (L3) system interconnect. The FPGA-to-HPS SDRAM interface supports AMBA AXI and Avalon® Memory-Mapped (Avalon-MM) interface standards, and provides up to six individual ports for access by masters implemented in the FPGA fabric.

To maximize memory performance, the SDRAM controller subsystem supports command and data reordering, deficit round-robin arbitration with aging, and high-priority bypass features. The SDRAM controller subsystem supports DDR2, DDR3, or LPDDR2 devices up to 4 Gb in density operating at up to 533 MHz (1066 Mbps data rate).

FPGA Configuration and Processor Booting

The FPGA fabric and HPS in the SoC are powered independently. You can reduce the clock frequencies or gate the clocks to reduce dynamic power, or shut down the entire FPGA fabric to reduce total system power.

Mode	Data Width	Max Clock Rate (MHz)	Max Data Rate (Mbps)	Decompression	Design Security	Partial Reconfiguration [20]	Remote System Update
FPP	8 bits	125	—	Yes	Yes	—	Parallel flash loader
	16 bits	125	—	Yes	Yes	Yes[21]

Instead of using an external flash or ROM, you can configure the Arria V devices through PCIe using CvP. The CvP mode offers the fastest configuration rate and flexibility with the easy-to-use PCIe hard IP block interface. The Arria V CvP implementation conforms to the PCIe 100 ms power-up-to-active time requirement.

Note: Although Arria V GZ devices support PCIe Gen3, you can use only PCIe Gen1 and PCIe Gen2 for CvP configuration scheme.

Power Management

Leveraging the FPGA architectural features, process technology advancements, and transceivers that are designed for power efficiency, the Arria V devices consume less power than previous generation Arria V FPGAs:

- Total device core power consumption—less by up to 50%.
- Transceiver channel power consumption—less by up to 50%.

Additionally, Arria V devices contain several hard IP blocks, including PCIe Gen1, Gen2, and Gen3, GbE, SRIO, GPON, and CPRI protocols, that reduce logic resources and deliver substantial power savings of up to 25% less power than equivalent soft implementations.

---

[20] Partial reconfiguration is an advanced feature of the device family. If you are interested in using partial reconfiguration, contact Altera for support.
[21] Supported at a maximum clock rate of 62.5 MHz.
[22] Arria V GZ only

Date	Version	Changes
June 2013	2013.06.03	• Removed statements about contacting Altera for SFF-8431 compliance requirements. Refer to the **Transceiver Architecture in Arria V Devices** chapter for the requirements.
May 2013	2013.05.06	• Moved all links to the Related Information section of respective topics for easy reference. • Added link to the known document issues in the Knowledge Base. • Updated the available options, maximum resource counts, and per package information for the Arria V SX and ST device variants. • Updated the variable DSP multipliers counts for the Arria V SX and ST device variants. • Clarified that partial reconfiguration is an advanced feature. Contact Altera for support of the feature. • Added footnote to clarify that MLAB 64 bits depth is available only for Arria V GZ devices. • Updated description about power-up sequence requirement for device migration to improve clarity.
January 2013	2013.01.11	• Added the L optional suffix to the Arria V GZ ordering code for the –I3 speed grade. • Added a note about the power-up sequence requirement if you plan to migrate your design from the Arria V GX A5 and A7, and Arria V GT C7 devices to other Arria V devices.
November 2012	2012.11.19	• Updated the summary of features. • Updated Arria V GZ information regarding 3.3 V I/O support. • Removed Arria V GZ engineering sample ordering code. • Updated the maximum resource counts for Arria V GX and GZ. • Updated Arria V ST ordering codes for transceiver count. • Updated transceiver counts for Arria V ST packages. • Added simplified floorplan diagrams for Arria V GZ, SX, and ST. • Added FPP x32 configuration mode for Arria V GZ only. • Updated CvP (PCIe) remote system update support information. • Added HPS external memory performance information. • Updated template.
October 2012	3.0	• Added Arria V GZ information. • Updated Table 1, Table 2, Table 3, Table 14, Table 15, Table 16, Table 17, Table 18, Table 19, Table 20, and Table 21. • Added the "Arria V GZ" section. • Added Table 8, Table 9 and Table 22.
