What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

12.7 8/16-bit PPG Timer Outline

The 8/16-bit PPG timer is a 2-channel reload timer module (PPG0 and PPG1) that allows outputting pulses of arbitrary cycle and duty cycle. Combination of the two channels allows selection among the following operations:

- 8-bit PPG output 2-channel independent operation mode
- 16-bit PPG output operation mode
- 8-bit and 8-bit PPG output operation mode

MB90385 series device has two 8/16-bit built-in PPG timers. This section describes functions of PPG0/1. PPG2/3 have the same functions as those of PPG0/1.

Functions of 8/16-bit PPG Timer

The 8/16-bit PPG timer is composed of four 8-bit reload register (PRLH0/PRLL0, PRLH1/PRLL1) and two PPG down counters (PCNT0, PCNT1).

- Widths of “H” and “L” in output pulse are specifiable independently. Cycle and duty factor of output pulse is specifiable arbitrarily.
- Count clock is selectable among 6 internal clocks.
- The timer is usable as an interval timer, by generating interrupt requests for each interval.
- The time is usable as a D/A converter, with an external circuit.

12.11 UART Outline

UART is a general-purpose serial data communication interface for synchronous and asynchronous communication using external devices.

- Provided with bi-directional communication function for both clock-synchronous and clock-asynchronous modes.
- Provided with master/slave communication function (multi-processor mode). (Only master side is available.)
- Interrupt request is generated upon completion of reception, completion of transmission and detection of reception error.
- Ready for expanded intelligent service, EI^{2}OS.

Table 12-3. UART Functions

	Description
Data buffer	Full-duplex double buffer
Transmission mode	Clock synchronous (No start/stop bit, no parity bit) Clock asynchronous (start-stop synchronous)
Baud rate	Built-in special-purpose baud-rate generator. Setting is selectable among 8 values. Input of external values is allowed. Use of clock from external timer (16-bit reload timer 0) is allowed.
Data length	7 bits (only asynchronous normal mode) 8 bits
Signaling system	Non Return to Zero (NRZ) system
Reception error detection	Framing error Overrun error Parity error (not detectable in operation mode 1 (multi-processor mode))
Interrupt request	Receive interrupt (reception completed, reception error detected) Transmission interrupt (transmission completed) Ready for expanded intelligent I/O service (EI^{2}OS) in both transmission and reception
Master/slave communication function (asynchronous, multi-processor mode)	Communication between 1 (master) and n (slaves) are available (usable as master only).

Note: Start/stop bit is not added upon clock-synchronous transmission. Data only is transmitted.

Table 12-4. UART Operation Modes
