Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	F²MC-16LX
Core Size	16-Bit
Speed	16MHz
Connectivity	CANbus, SCI, UART/USART
Peripherals	POR, WDT
Number of I/O	36
Program Memory Size	64KB (64K x 8)
Program Memory Type	Mask ROM
EEPROM Size	-
RAM Size	2K x 8
Voltage - Supply (Vcc/Vdd)	3.5V ~ 5.5V
Data Converters	A/D 8x8/10b
Oscillator Type	External
Operating Temperature	-40°C ~ 105°C (TA)
Mounting Type	Surface Mount
Package / Case	48-LQFP
Supplier Device Package	48-LQFP (7x7)
Purchase URL	https://www.e-xfl.com/product-detail/infineon-technologies/mb90387spmt-gs-126

MB90387/387S/F387/F387S
MB90V495G

16-bit Microcontrollers
F²MC-16LX MB90385 Series

MB90385 series devices are general-purpose high-performance 16-bit micro controllers designed for process control of consumer products, which require high-speed real-time processing. The devices of this series have the built-in full-CAN interface.
The system, inheriting the architecture of F²MC family, employs additional instruction ready for high-level languages, expanded addressing mode, enhanced multiply-divide instructions, and enriched bit-processing instructions. Furthermore, employment of 32-bit accumulator achieves processing of long-word data (32 bits).
The peripheral resources of MB90385 series include the following:
8/10-bit A/D converter, UART (SCI), 8/16-bit PPG timer, 16-bit input-output timer (16-bit free-run timer, input capture 0, 1, 2, 3 (ICU)), and CAN controller.

Features

Clock

- Built-in PLL clock frequency multiplication circuit
- Selection of machine clocks (PLL clocks) is allowed among frequency division by two on oscillation clock, and multiplication of 1 to 4 times of oscillation clock (for 4-MHz oscillation clock, 4 MHz to 16 MHz).
- Operation by sub-clock (8.192 kHz) is allowed. (MB90387, MB90F387)
- Minimum execution time of instruction: 62.5 ns (when operating with 4-MHz oscillation clock, and 4-time multiplied PLL clock).

16 Mbyte CPU memory Space

- 24-bit internal addressing

Instruction System Best Suited to Controller

- Wide choice of data types (bit, byte, word, and long word)
- Wide choice of addressing modes (23 types)
- Enhanced multiply-divide instructions and RETI instructions
- Enhanced high-precision computing with 32-bit accumulator

Instruction System Compatible with High-level Language (C language) and Multitask

- Employing system stack pointer
- Enhanced various pointer indirect instructions
- Barrel shift instructions

Increased Processing Speed

- 4-byte instruction queue

Powerful Interrupt Function with 8 Levels and 34 Factors

Automatic Data Transfer Function Independent of CPU

- Expanded intelligent I/O service function (EI² OS): Maximum of 16 channels

Low Power Consumption (standby) Mode

- Sleep mode (a mode that halts CPU operating clock)
- Time-base timer mode (a mode that operates oscillation clock, sub clock, time-base timer and watch timer only)
- Watch mode (a mode that operates sub clock and watch timer only)
- Stop mode (a mode that stops oscillation clock and sub clock)
- CPU blocking operation mode

Process

- CMOS technology

I/O Port

- General-purpose input/output port (CMOS output):

  MB90387, MB90F387: 34 ports (including 4 high-current output ports)
  MB90387S, MB90F387S: 36 ports (including 4 high-current output ports)

Timer

- Time-base timer, watch timer, watchdog timer: 1 channel
- 8/16-bit PPG timer: 8-bit x 4 channels, or 16-bit x 2 channels
- 16-bit reload timer: 2 channels
- 16-bit input/output timer
  - ❒ 16-bit free run timer: 1 channel
  - ❒ 16-bit input capture: (ICU): 4 channels

  Interrupt request is issued upon latching a count value of 16-bit free run timer by detection of an edge on pin input.

CAN Controller: 1 channel

- Compliant with Ver2.0A and Ver2.0B CAN specifications
- 8 built-in message buffers
- Transmission rate of 10 kbps to 1 Mbps (by 16 MHz machine clock)
- CAN wake-up

UART (SCI): 1 channel

- Equipped with full-duplex double buffer
- Clock-asynchronous or clock-synchronous serial transmission is available.

1. Product Lineup

Parameter \ Part Number		MB90F387 MB90F387S	MB90387 MB90387S	MB90V495G
Classification		Flash ROM	Mask ROM	Evaluation product
ROM capacity		64 Kbytes		–
RAM capacity		2 Kbytes		6 Kbytes
Process		CMOS		
Package		LQFP-48 (pin pitch 0.50 mm)		PGA-256
Operating power supply voltage		3.5 V to 5.5 V		4.5 V to 5.5 V
Special power supply for emulator*1		–		None
CPU functions		Number of basic instructions : 351 instructions Instruction bit length : 8 bits and 16 bits Instruction length : 1 byte to 7 bytes Data bit length : 1 bit, 8 bits, 16 bits		
		Minimum instruction execution time: 62.5 ns (at 16 MHz machine clock)		
		Interrupt processing time: 1.5 μs at minimum (at 16 MHz machine clock)		
Low power consumption (standby) mode		Sleep mode / Watch mode / Time-base timer mode / Stop mode / CPU intermittent		
I/O port		General-purpose input/output ports (CMOS output): 34 ports (36 ports*2) including 4 high-current output ports (P14 to P17)		
Time-base timer		18-bit free-run counter Interrupt cycle: 1.024 ms, 4.096 ms, 16.834 ms, 131.072 ms (with oscillation clock frequency at 4 MHz)		
Watchdog timer		Reset generation cycle: 3.58 ms, 14.33 ms, 57.23 ms, 458.75 ms (with oscillation clock frequency at 4 MHz)		
16-bit input/ output timer	16-bit free-run timer	Number of channels: 1 Interrupt upon occurrence of overflow		
	Input capture	Number of channels: 4 Retaining free-run timer value set by pin input (rising edge, falling edge, and both edges)		
16-bit reload timer		Number of channels: 2 16-bit reload timer operation Count clock cycle: 0.25 μs, 0.5 μs, 2.0 μs (at 16-MHz machine clock frequency) External event count is allowed.		
Watch timer		15-bit free-run counter Interrupt cycle: 31.25 ms, 62.5 ms, 12 ms, 250 ms, 500 ms, 1.0 s, 2.0 s (with 8.192 kHz sub clock)		
8/16-bit PPG timer		Number of channels: 2 (four 8-bit channels are available also.) PPG operation is allowed with four 8-bit channels or two 16-bit channels. Outputting pulse wave of arbitrary cycle or arbitrary duty is allowed. Count clock: 62.5 ns to 1 μs (with 16 MHz machine clock)		
Delay interrupt generator module		Interrupt generator module for task switching. Used for realtime OS.		
DTP/External interrupt		Number of inputs: 4 Activated by rising edge, falling edge, “H” level or “L” level input. External interrupt or expanded intelligent I/O service (EI^{2}OS) is available.		

Notes When Using No Sub Clock

■ If an oscillator is not connected to X0A and X1A pin, apply pull-down resistor to X0A pin and leave X1A pin open.

About Power Supply Pins

■ If two or more Vcc and Vss pins exist, the pins that should be at the same potential are connected to each other inside the device. For reducing unwanted emissions and preventing malfunction of strobe signals caused by increase of ground level, however, be sure to connect the Vcc and Vss pins to the power source and the ground externally.

■ Pay attention to connect a power supply to Vcc and Vss of MB90385 series device in a lowest-possible impedance.

■ Near pins of MB90385 series device, connecting a bypass capacitor is recommended at 0.1 μF across Vcc pin and Vss pin.

Crystal Oscillator Circuit

■ Noises around X0 and X1 pins cause malfunctions on a MB90385 series device. Design a print circuit so that X0 and X1 pins, an crystal oscillator (or a ceramic oscillator), and bypass capacitor to the ground become as close as possible to each other. Furthermore, avoid wires to X0 and X1 pins crossing each other as much as possible.

■ Print circuit designing that surrounds X0 and X1 pins with grounding wires, which ensures stable operation, is strongly recommended.

Caution on Operations during PLL Clock Mode

■ If the PLL clock mode is selected, the microcontroller attempt to be working with the self-oscillating circuit even when there is no external oscillator or external clock input is stopped. Performance of this operation, however, cannot be guaranteed.

Sequence of Turning on Power of A/D Converter and Applying Analog Input

■ Be sure to turn on digital power (Vcc) before applying signals to the A/D converter and applying analog input signals (AN0 to AN7 pins).

■ Be sure to turn off the power of A/D converter and analog input before turning off the digital power source.

■ Be sure not to apply AVR exceeding AVcc when turning on and off. (No problems occur if analog and digital power is turned on and off simultaneously.)

Handling Pins When A/D Converter is Not Used

■ If the A/D converter is not used, connect the pins under the following conditions: “AVcc=AVR=Vcc,” and “AVss=Vss”

Note on Turning on Power

■ For preventing malfunctions on built-in step-down circuit, maintain a minimum of 50 μs of voltage rising time (between 0.2 V and 2.7V) when turning on the power.

Stabilization of Supply Voltage

■ A sudden change in the supply voltage may cause the device to malfunction even within the specified V_{CC} supply voltage operating range. Therefore, the V_{CC} supply voltage should be stabilized.
For reference, the supply voltage should be controlled so that V_{CC} ripple variations (peak-to-peak values) at commercial frequencies (50 Hz / 60 Hz) fall below 10% of the standard V_{CC} supply voltage and the coefficient of fluctuation does not exceed 0.1 V/ms at instantaneous power switching.

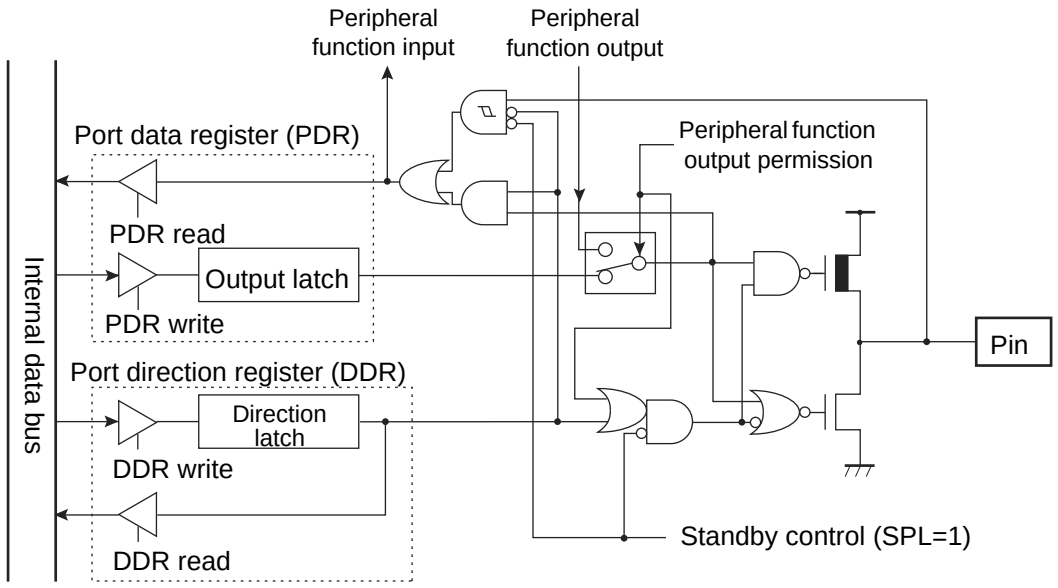
Port 3 Pins Block Diagram (general-purpose input/output port)



Standby control: Control among Stop mode (SPL=1), Time-base timer mode (SPL=1), and watch mode (SPL=1).

Port 3 Registers

■ Port 3 registers include port 3 data register (PDR3) and port 3 direction register (DDR3).

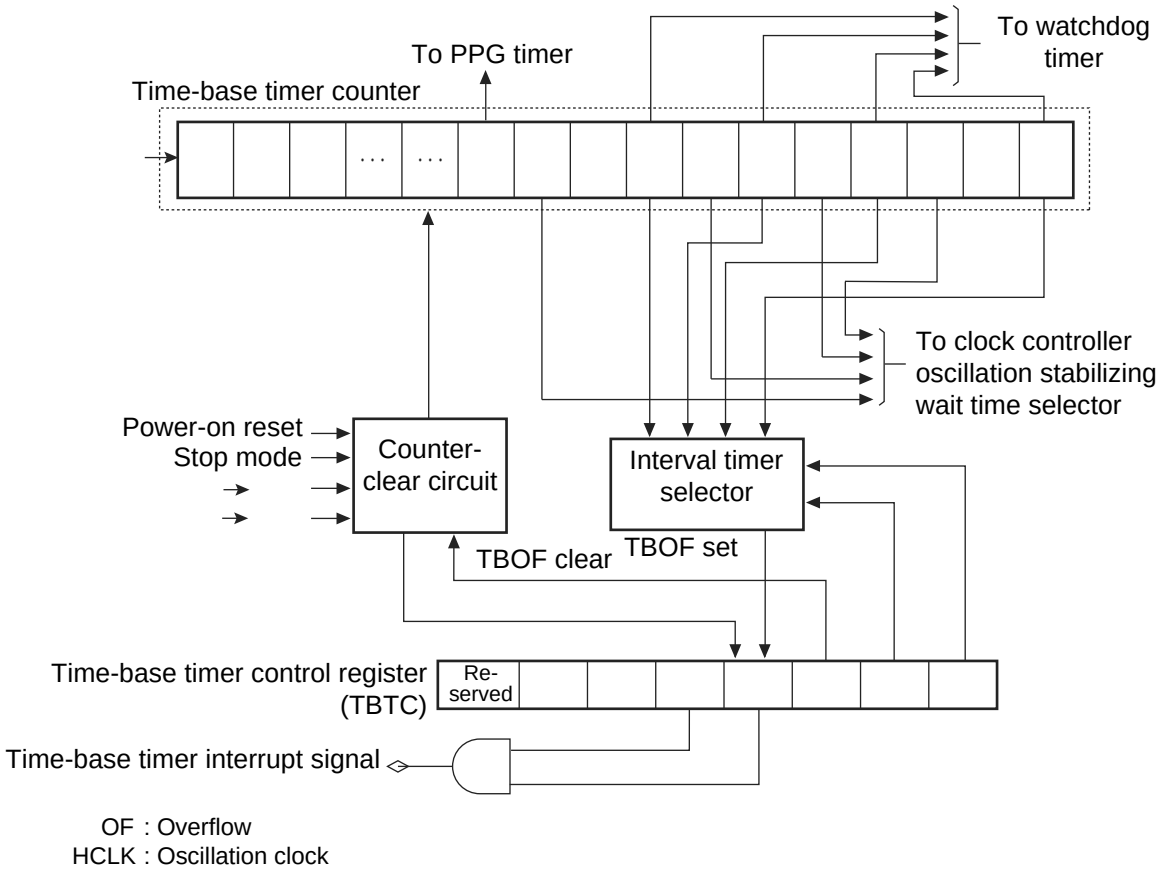
■ The bits configuring the register correspond to port 3 pins on a one-to-one basis.

Relation between Port 3 Registers and Pins

Port Name	Bits of Register and Corresponding Pins								
Port 3	PDR3, DDR3	bit7	bit6	bit5	bit4	bit3	bit2	bit1	bit0
	Corresponding pins	P37	P36*	P35*	–	P33	P32	P31	P30

*: P35 and P36 do not exist on MB90387and MB90F387.

Time-base Timer Block Diagram



OF : Overflow
HCLK : Oscillation clock

*1: Switch machine clock from main clock to PLL clock.

*2: Switch machine clock from sub clock to main clock.

Actual interrupt request number of time-base timer is as follows:

Interrupt request number: #16 (10_H)

12.6 Watch Timer Outline

The watch timer is a 15-bit free-run counter that increments in synchronization with sub clock.

- Interval time is selectable among 7 choices, and generation of interrupt request is allowed for each interval.
- Provides operation clock to the subclock oscillation stabilizing wait timer and watchdog timer.
- Always uses subclock as a count clock regardless of settings of clock selection register (CKSCR).

Interval Timer Function

- In the watch timer, a bit corresponding to the interval time overflows (carry-over) when an interval time, which is specified by interval time selection bit, is reached. Then overflow flag bit is set (WTC: WTOF=1).
- If an interrupt by overflow is permitted (WTC: WTIE=1), an interrupt request is generated upon setting an overflow flag bit.
- Interval time of watch timer is selectable among the following seven choices:

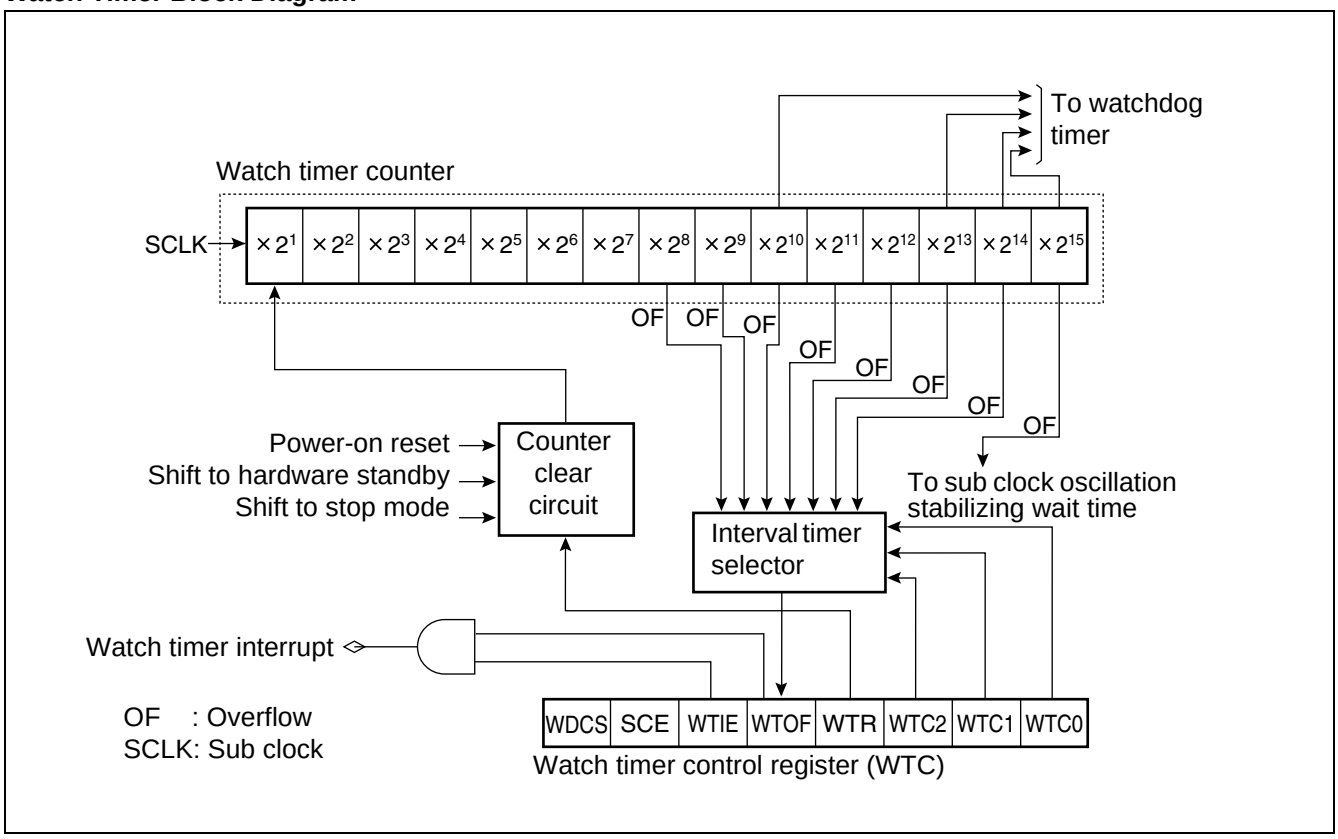
Interval Time of Watch Timer

Sub Clock Cycle	Interval Time
1/SCLK (122 μs)	2^8/SCLK (31.25 ms)
	2^9/SCLK (62.5 ms)
	2^{10}/SCLK (125 ms)
	2^{11}/SCLK (250 ms)
	2^{12}/SCLK (500 ms)
	2^{13}/SCLK (1.0 s)
	2^{14}/SCLK (2.0 s)

SCLK: Sub clock frequency

Values in parentheses “( )” are calculation when operating with 8.192 kHz clock.

Watch Timer Block Diagram



Actual interrupt request number of watch timer is as follows:
Interrupt request number: #28 ($1C_H$)

Watch Timer Counter

A 15-bit up counter that uses sub clock (SCLK) as a count clock.

Counter Clear Circuit

A circuit that clears the watch timer counter.

12.7 8/16-bit PPG Timer Outline

The 8/16-bit PPG timer is a 2-channel reload timer module (PPG0 and PPG1) that allows outputting pulses of arbitrary cycle and duty cycle. Combination of the two channels allows selection among the following operations:

- 8-bit PPG output 2-channel independent operation mode
- 16-bit PPG output operation mode
- 8-bit and 8-bit PPG output operation mode

MB90385 series device has two 8/16-bit built-in PPG timers. This section describes functions of PPG0/1. PPG2/3 have the same functions as those of PPG0/1.

Functions of 8/16-bit PPG Timer

The 8/16-bit PPG timer is composed of four 8-bit reload register (PRLH0/PRLL0, PRLH1/PRLL1) and two PPG down counters (PCNT0, PCNT1).

- Widths of “H” and “L” in output pulse are specifiable independently. Cycle and duty factor of output pulse is specifiable arbitrarily.
- Count clock is selectable among 6 internal clocks.
- The timer is usable as an interval timer, by generating interrupt requests for each interval.
- The time is usable as a D/A converter, with an external circuit.

12.9 DTP/External Interrupt and CAN Wakeup Outline

DTP/external interrupt transfers an interrupt request generated by an external peripheral device or a data transmission request to CPU, generating external interrupt request and activating expanded intelligent I/O service. Input RX of CAN controller is used as external interrupt input.

DTP/External Interrupt and CAN Wakeup Function

An interrupt request input from external peripheral device to external input pins (INT7 to INT4) and RX pin, just as interrupt request of peripheral device, generates an interrupt request. The interrupt request generates an external interrupt and activates expanded intelligent I/O service (EI^2OS).

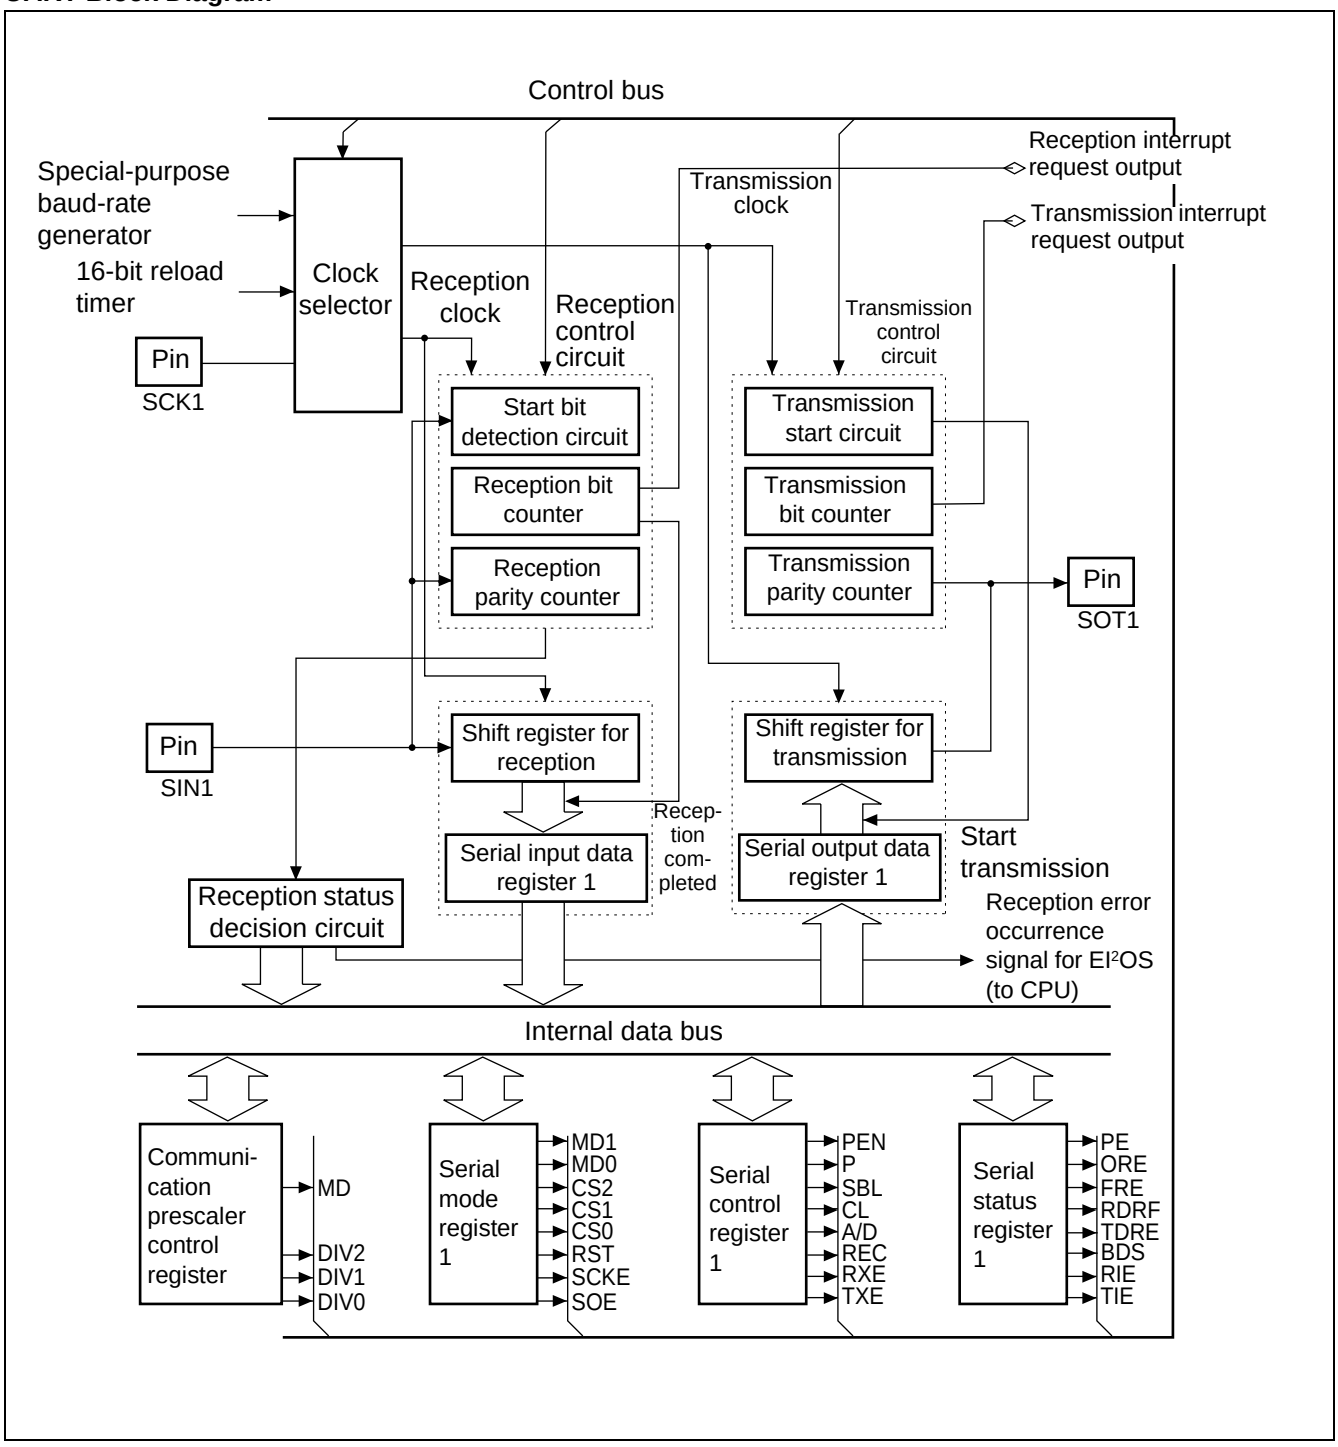
If the expanded intelligent I/O service (EI^2OS) has been disabled by interrupt control register (ICR: ISE=0), external interrupt function is enabled and branches to interrupt processing.

If the EI^2OS has been enabled, (ICR: ISE=1), DTP function is enabled and automatic data transmission is performed by EI^2OS. After performing specified number of data transmission processes, the process branches to interrupt processing.

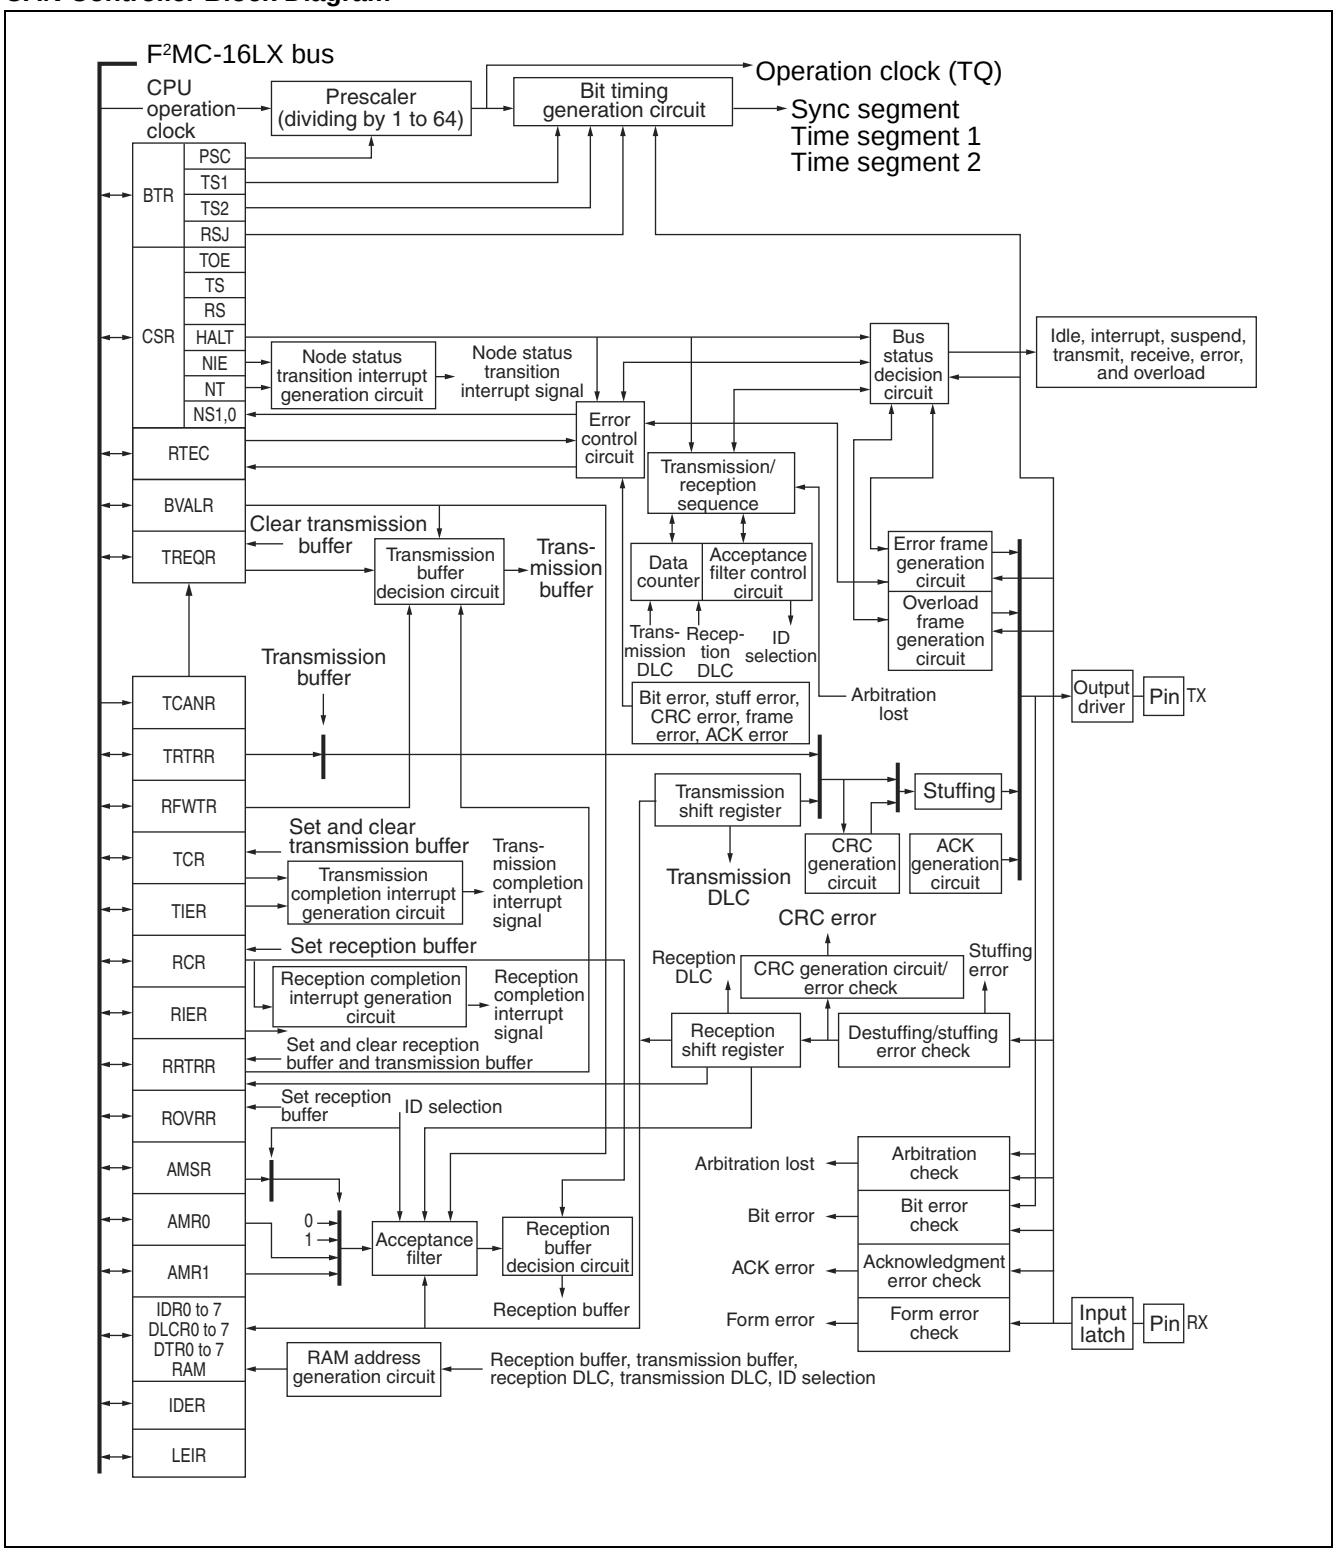
Table 12-2. DTP/External Interrupt and CAN Wakeup Outline

	External Interrupt	DTP Function
Input pin	5 pins (RX, and INT4 to INT7)	
Interrupt cause	Specify for each pin with detection level setting register (ELVR).	
	Input of “H” level/“L” level/rising edge/falling edge.	Input of “H” level/ “L” level
Interrupt number	#15 ($0F_H$), #24 (18_H), #27 ($1B_H$)	
Interrupt control	Enabling or disabling output of interrupt request, using DTP/external interrupt permission register (ENIR).	
Interrupt flag	Retaining interrupt cause with DTP/external interrupt cause register (EIRR).	
Process selection	Disable EI^2OS (ICR: ISE=0)	Enable EI^2OS (ICR: ISE=1)
Process	Branch to external interrupt process	After automatic data transmission by EI^2OS for specified number of times, branch to interrupt process.

UART Block Diagram



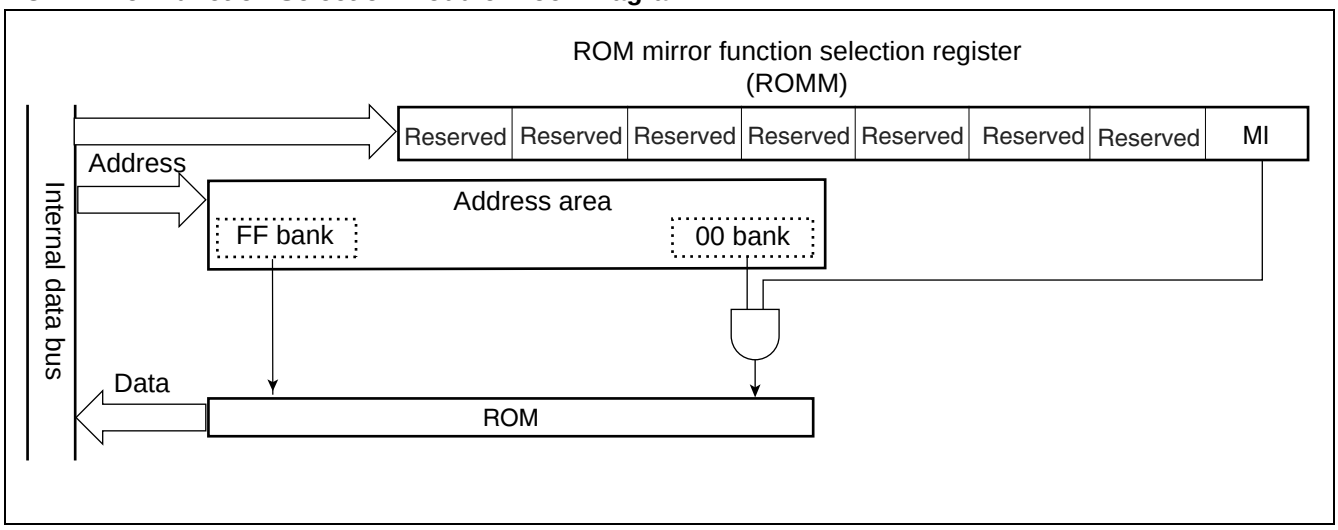
CAN Controller Block Diagram



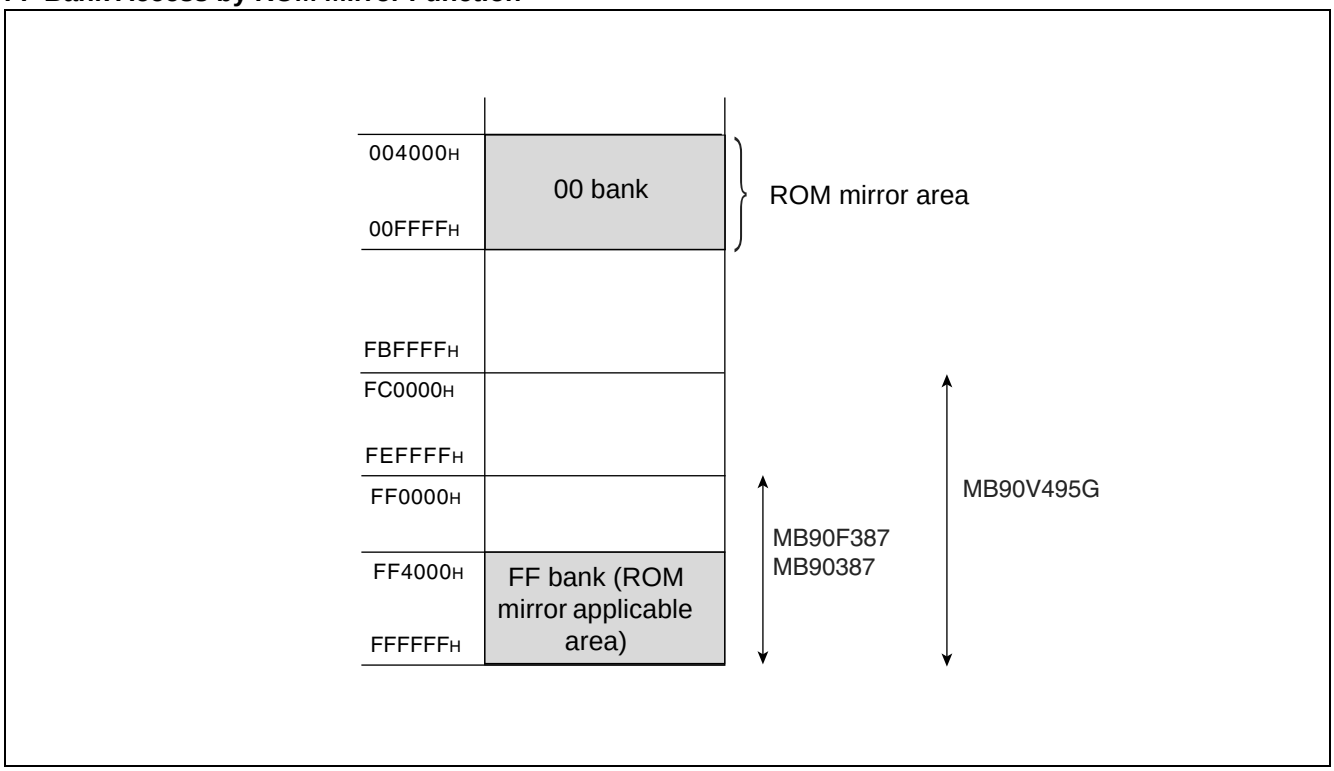
12.14 ROM Mirror Function Selection Module Outline

The ROM mirror function selection module sets the data in ROM assigned to FF bank so that the data is read by access to 00 bank.

ROM Mirror Function Selection Module Block Diagram



FF Bank Access by ROM Mirror Function



Sector Configuration of 512 Kbit Flash Memory

Flash memory	CPU address	Writer address*
SA0 (32 Kbytes)	FF0000H FF7FFFH	70000H 77FFFH
SA1 (8 Kbytes)	FF8000H FF9FFFH	78000H 79FFFH
SA2 (8 Kbytes)	FFA000H FFBFFFH	7A000H 7BFFFH
SA3 (16 Kbytes)	FFC000H FFFFFFH	7C000H 7FFFFH

*: “Writer address” is an address equivalent to CPU address, which is used when data is written on Flash memory, using parallel writer. When writing/deleting data with general-purpose writer, the writer address is used for writing and deleting.

13. Electrical Characteristics

13.1 Absolute Maximum Rating

Parameter	Symbol	Rating		Unit	Remarks
		Min	Max		
Power supply voltage*1	V_{CC}	V_{SS} – 0.3	V_{SS} + 6.0	V	
	AV_{CC}	V_{SS} – 0.3	V_{SS} + 6.0	V	$V_{CC} = AV_{CC}$*2
	AVR	V_{SS} – 0.3	V_{SS} + 6.0	V	$AV_{CC} \geq AVR$*2
Input voltage*1	V_I	V_{SS} – 0.3	V_{SS} + 6.0	V	*3
Output voltage*1	V_O	V_{SS} – 0.3	V_{SS} + 6.0	V	*3
Maximum clamp current	I_{CLAMP}	– 2.0	+ 2.0	mA	*7
Total maximum clamp current	$\Sigma \mid I_{CLAMP} \mid$	–	20	mA	*7
“L” level maximum output current	I_{OL1}	–	15	mA	Normal output*4
	I_{OL2}	–	40	mA	High-current output*4
“L” level average output current	I_{OLAV1}	–	4	mA	Normal output*5
	I_{OLAV2}	–	30	mA	High-current output*5
“L” level maximum total output current	ΣI_{OL1}	–	125	mA	Normal output
	ΣI_{OL2}	–	160	mA	High-current output
“L” level average total output current	ΣI_{OLAV1}	–	40	mA	Normal output*6
	ΣI_{OLAV2}	–	40	mA	High-current output*6
“H” level maximum output current	I_{OH1}	–	–15	mA	Normal output*4
	I_{OH2}	–	–40	mA	High-current output*4
“H” level average output current	I_{OHAV1}	–	–4	mA	Normal output*5
	I_{OHAV2}	–	–30	mA	High-current output*5
“H” level maximum total output current	ΣI_{OH1}	–	–125	mA	Normal output
	ΣI_{OH2}	–	–160	mA	High-current output
“H” level average total output current	ΣI_{OHAV1}	–	–40	mA	Normal output*6
	ΣI_{OHAV2}	–	–40	mA	High-current output*6
Power consumption	P_D	–	245	mW	
Operating temperature	T_A	–40	+105	°C	
Storage temperature	Tstg	–55	+150	°C	

*1: The parameter is based on $V_{SS} = AV_{SS} = 0.0$ V.

*2: AVcc and AVR should not exceed Vcc.

*3: V_I and V_O should not exceed Vcc + 0.3 V. However if the maximum current to/from an input is limited by some means with external components, the I_{CLAMP} rating supersedes the V_I rating.

*4: A peak value of an applicable one pin is specified as a maximum output current.

*5: An average current value of an applicable one pin within 100 ms is specified as an average output current. (Average value is found by multiplying operating current by operating rate.)

*6: An average current value of all pins within 100 ms is specified as an average total output current. (Average value is found by multiplying operating current by operating rate.)

*7:

■ Applicable to pins: P10 to P17, P20 to P27, P30 to P33, P35*, P36*, P37, P40 to P44, P50 to P57
*: P35 and P36 are MB90387S and MB90F387S only.

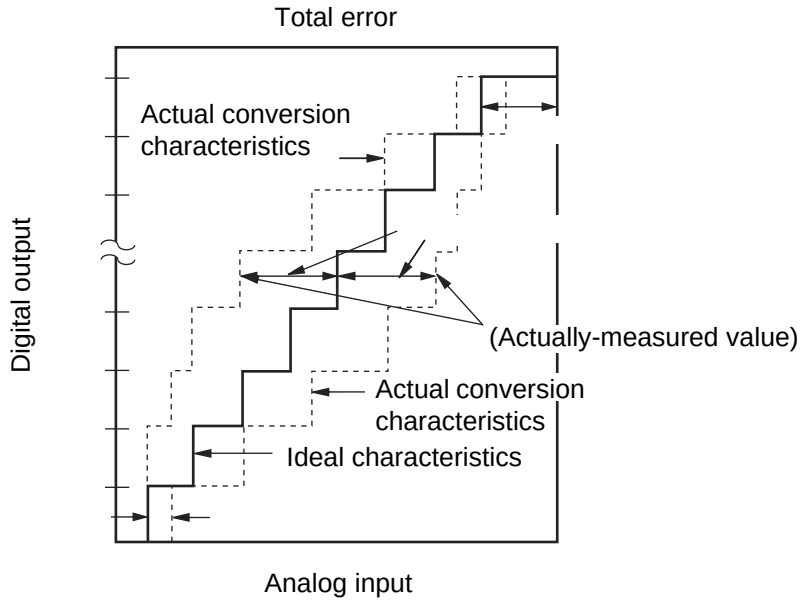
(V_{CC} = 5.0 V±10%, V_{SS} = AV_{SS} = 0.0 V, T_A = –40 °C to +105 °C)

Parameter	Symbol	Pin Name	Conditions	Value			Unit	Remarks
				Min	Typ	Max		
Power supply current*	I_{CCL}	V_{CC}	V_{CC} = 5.0 V, Internally operating at 8 kHz, subclock operation, T_A = + 25°C	—	0.3	1.2	mA	MB90F387/S
				—	40	100	µA	MB90387/S
	I_{CCLS}		V_{CC} = 5.0 V, Internally operating at 8 kHz, subclock, sleep mode, T_A = + 25°C	—	10	30	µA	
	I_{CCT}		V_{CC} = 5.0 V, Internally operating at 8 kHz, watch mode, T_A = + 25°C	—	8	25	µA	
	I_{CCH}		Stopping, T_A = + 25°C	—	5	20	µA	
Input capacity	C_{IN}	Other than AV_{CC}, AV_{SS}, AVR, C, V_{CC}, V_{SS}	–	—	5	15	pF	
Pull-up resistor	R_{UP}	RST	–	25	50	100	kΩ	
Pull-down resistor	R_{DOWN}	MD2	–	25	50	100	kΩ	Flash product is not provided with pull-down resistor.

*: Test conditions of power supply current are based on a device using external clock.

13.6 Definition of A/D Converter Terms

Resolution:	Analog variation that is recognized by an A/D converter.
Linear error:	Deviation between a line across zero-transition line (“00 0000 00 0 0” ←→“00 0000 0001”) and full-scale transition line (“11 1111 11 1 0” ←→ “11 1111 1111”) and actual conversion characteristics.
Differential linear error:	Deviation of input voltage, which is required for changing output code by 1 LSB, from an ideal value.
Total error:	Difference between an actual value and an ideal value. A total error includes zero transition error, full-scale transition error, and linear error.



$$\text{Total error of digital output “N”} = \frac{V_{NT} - \{1\ \text{LSB} \times (N - 1) + 0.5\ \text{LSB}\}}{1\ \text{LSB}} \quad [\text{LSB}]$$

$$1\ \text{LSB} = (\text{Ideal value})\ \frac{AVR - AV_{SS}}{1024}\ [V]$$

V_{OT} (Ideal value) = AV_{SS} + 0.5 LSB [V]

V_{FST} (Ideal value) = AVR − 1.5 LSB [V]

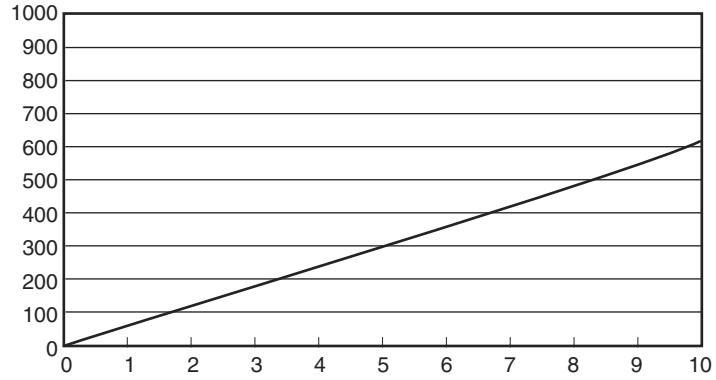
V_{NT}: A voltage at which digital output transits from $(N\text{-}1)_H$ to N_H.

(Continued)

(Continued)

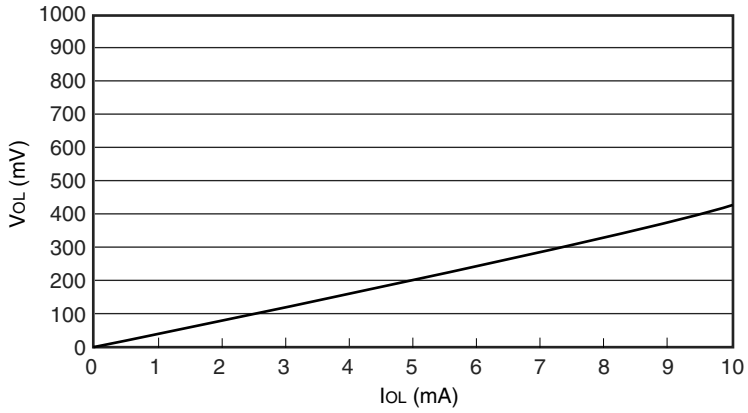
(V_{CC} - V_{OH}) – I_{OH}

T_A = +25 °C, V_{CC} = 4.5 V



V_{OL} – I_{OL}

T_A = +25 °C, V_{CC} = 4.5 V



H level input voltage/ L level input voltage
V_{IN} – V_{CC}

T_A = +25 °C
