Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	F²MC-16LX
Core Size	16-Bit
Speed	16MHz
Connectivity	CANbus, SCI, UART/USART
Peripherals	POR, WDT
Number of I/O	36
Program Memory Size	64KB (64K x 8)
Program Memory Type	Mask ROM
EEPROM Size	-
RAM Size	2K x 8
Voltage - Supply (Vcc/Vdd)	3.5V ~ 5.5V
Data Converters	A/D 8x8/10b
Oscillator Type	External
Operating Temperature	-40°C ~ 105°C (TA)
Mounting Type	Surface Mount
Package / Case	48-LQFP
Supplier Device Package	48-LQFP (7x7)
Purchase URL	https://www.e-xfl.com/product-detail/infineon-technologies/mb90387spmt-gs-156

Notes When Using No Sub Clock

■ If an oscillator is not connected to X0A and X1A pin, apply pull-down resistor to X0A pin and leave X1A pin open.

About Power Supply Pins

■ If two or more Vcc and Vss pins exist, the pins that should be at the same potential are connected to each other inside the device. For reducing unwanted emissions and preventing malfunction of strobe signals caused by increase of ground level, however, be sure to connect the Vcc and Vss pins to the power source and the ground externally.

■ Pay attention to connect a power supply to Vcc and Vss of MB90385 series device in a lowest-possible impedance.

■ Near pins of MB90385 series device, connecting a bypass capacitor is recommended at 0.1 μF across Vcc pin and Vss pin.

Crystal Oscillator Circuit

■ Noises around X0 and X1 pins cause malfunctions on a MB90385 series device. Design a print circuit so that X0 and X1 pins, an crystal oscillator (or a ceramic oscillator), and bypass capacitor to the ground become as close as possible to each other. Furthermore, avoid wires to X0 and X1 pins crossing each other as much as possible.

■ Print circuit designing that surrounds X0 and X1 pins with grounding wires, which ensures stable operation, is strongly recommended.

Caution on Operations during PLL Clock Mode

■ If the PLL clock mode is selected, the microcontroller attempt to be working with the self-oscillating circuit even when there is no external oscillator or external clock input is stopped. Performance of this operation, however, cannot be guaranteed.

Sequence of Turning on Power of A/D Converter and Applying Analog Input

■ Be sure to turn on digital power (Vcc) before applying signals to the A/D converter and applying analog input signals (AN0 to AN7 pins).

■ Be sure to turn off the power of A/D converter and analog input before turning off the digital power source.

■ Be sure not to apply AVR exceeding AVcc when turning on and off. (No problems occur if analog and digital power is turned on and off simultaneously.)

Handling Pins When A/D Converter is Not Used

■ If the A/D converter is not used, connect the pins under the following conditions: “AVcc=AVR=Vcc,” and “AVss=Vss”

Note on Turning on Power

■ For preventing malfunctions on built-in step-down circuit, maintain a minimum of 50 μs of voltage rising time (between 0.2 V and 2.7V) when turning on the power.

Stabilization of Supply Voltage

■ A sudden change in the supply voltage may cause the device to malfunction even within the specified V_{CC} supply voltage operating range. Therefore, the V_{CC} supply voltage should be stabilized.
For reference, the supply voltage should be controlled so that V_{CC} ripple variations (peak-to-peak values) at commercial frequencies (50 Hz / 60 Hz) fall below 10% of the standard V_{CC} supply voltage and the coefficient of fluctuation does not exceed 0.1 V/ms at instantaneous power switching.

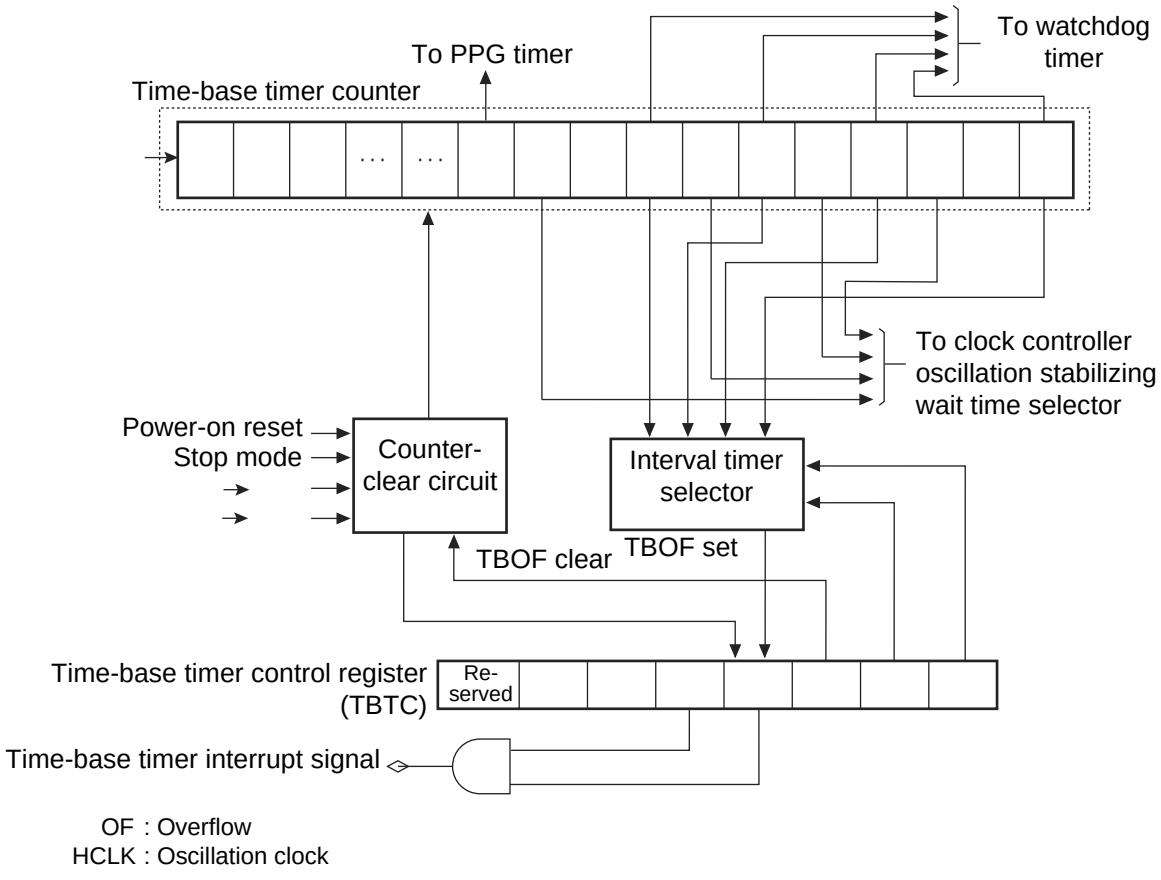
Time-base Timer Block Diagram



OF : Overflow
HCLK : Oscillation clock

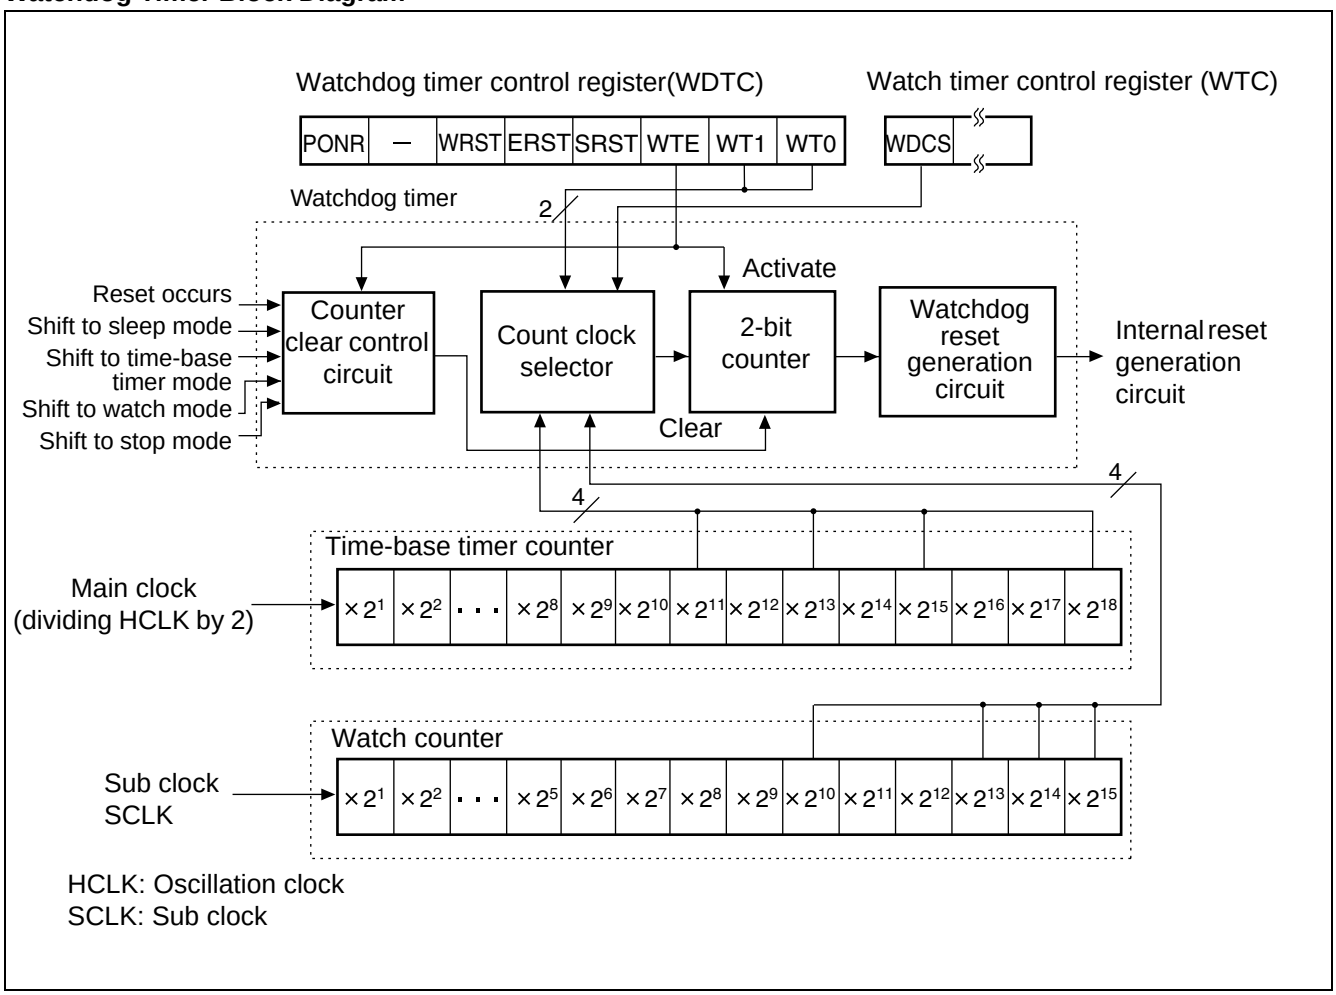
*1: Switch machine clock from main clock to PLL clock.

*2: Switch machine clock from sub clock to main clock.

Actual interrupt request number of time-base timer is as follows:

Interrupt request number: #16 (10_H)

Watchdog Timer Block Diagram



12.4 16-bit Input/Output Timer

The 16-bit input/output timer is a compound module composed of 16-bit free-run timer, (1 unit) and input capture (2 units, 4 input pins). The timer, using the 16-bit free-run timer as a basis, enables measurement of clock cycle of an input signal and its pulse width.

Configuration of 16-bit Input/Output Timer

The 16-bit input/output timer is composed of the following modules:

- 16-bit free-run timer (1 unit)
- Input capture (2 units, 2 input pins per unit)

Functions of 16-bit Input/Output Timer

Functions of 16-bit Free-run Timer

The 16-bit free-run timer is composed of 16-bit up counter, timer counter control status register, and prescaler. The 16-bit up counter increments in synchronization with dividing ratio of machine clock.

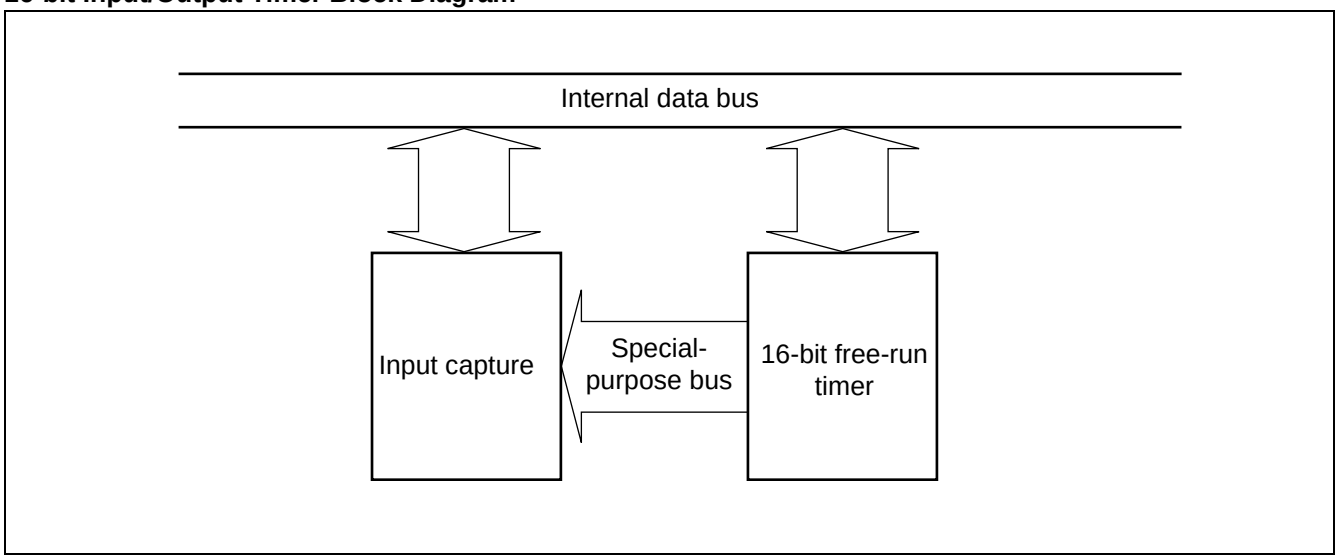
- Count clock is set among four types of machine clock dividing rates.
- Generation of interrupt is allowed by counter value overflow.
- Activation of expanded intelligent I/O service (EI^{2}OS) is allowed by interrupt generation.
- Counter value of 16-bit free-run timer is cleared to "0000$_H$" by either resetting or software-clearing with timer count clear bit (TCCS: CLR).
- Counter value of 16-bit free-run timer is output to input capture, which is available as base time for capture operation.

Functions of Input Capture

The input capture, upon detecting an edge of a signal input to the input pin from external device, stores a counter value of 16-bit free-run timer at the time of detection into the input capture data register. The function includes the input capture data registers corresponding to four input pins, input capture control status register, and edge detection circuit.

- Rising edge, falling edge, and both edges are selectable for detection.
- Generating interrupt on CPU is allowed by detecting an edge of input signal.
- Expanded intelligent I/O service (EI^{2}OS) is activated by interrupt generation.
- The four input capture input pins and input capture data registers allows monitoring of a maximum of four events.

16-bit Input/Output Timer Block Diagram



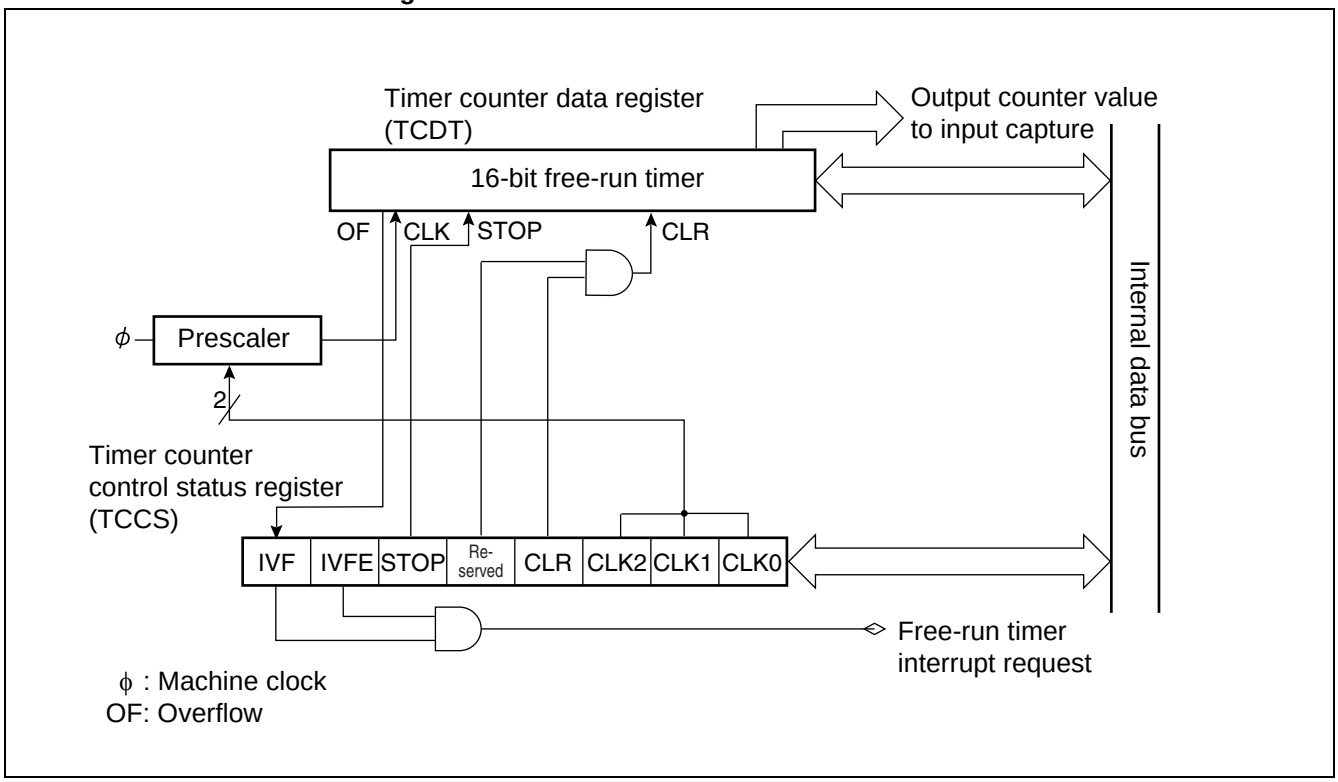
16-bit Free-run Timer

Counter value of 16-bit free-run timer is used as reference time (base time) of input capture.

Input Capture

Input capture detects rising edge, falling edge or both edges and retains a counter value of 16-bit free-run timer. Detection of edge on input signal is allowed to generate interrupt.

16-bit Free-run Timer Block Diagram



Detailed Pin Assignment on Block Diagram

The 16-bit input/output timer includes a 16-bit free-run timer. Interrupt request number of the 16-bit free-run timer is as follows:
Interrupt request number: 19 (13_H)

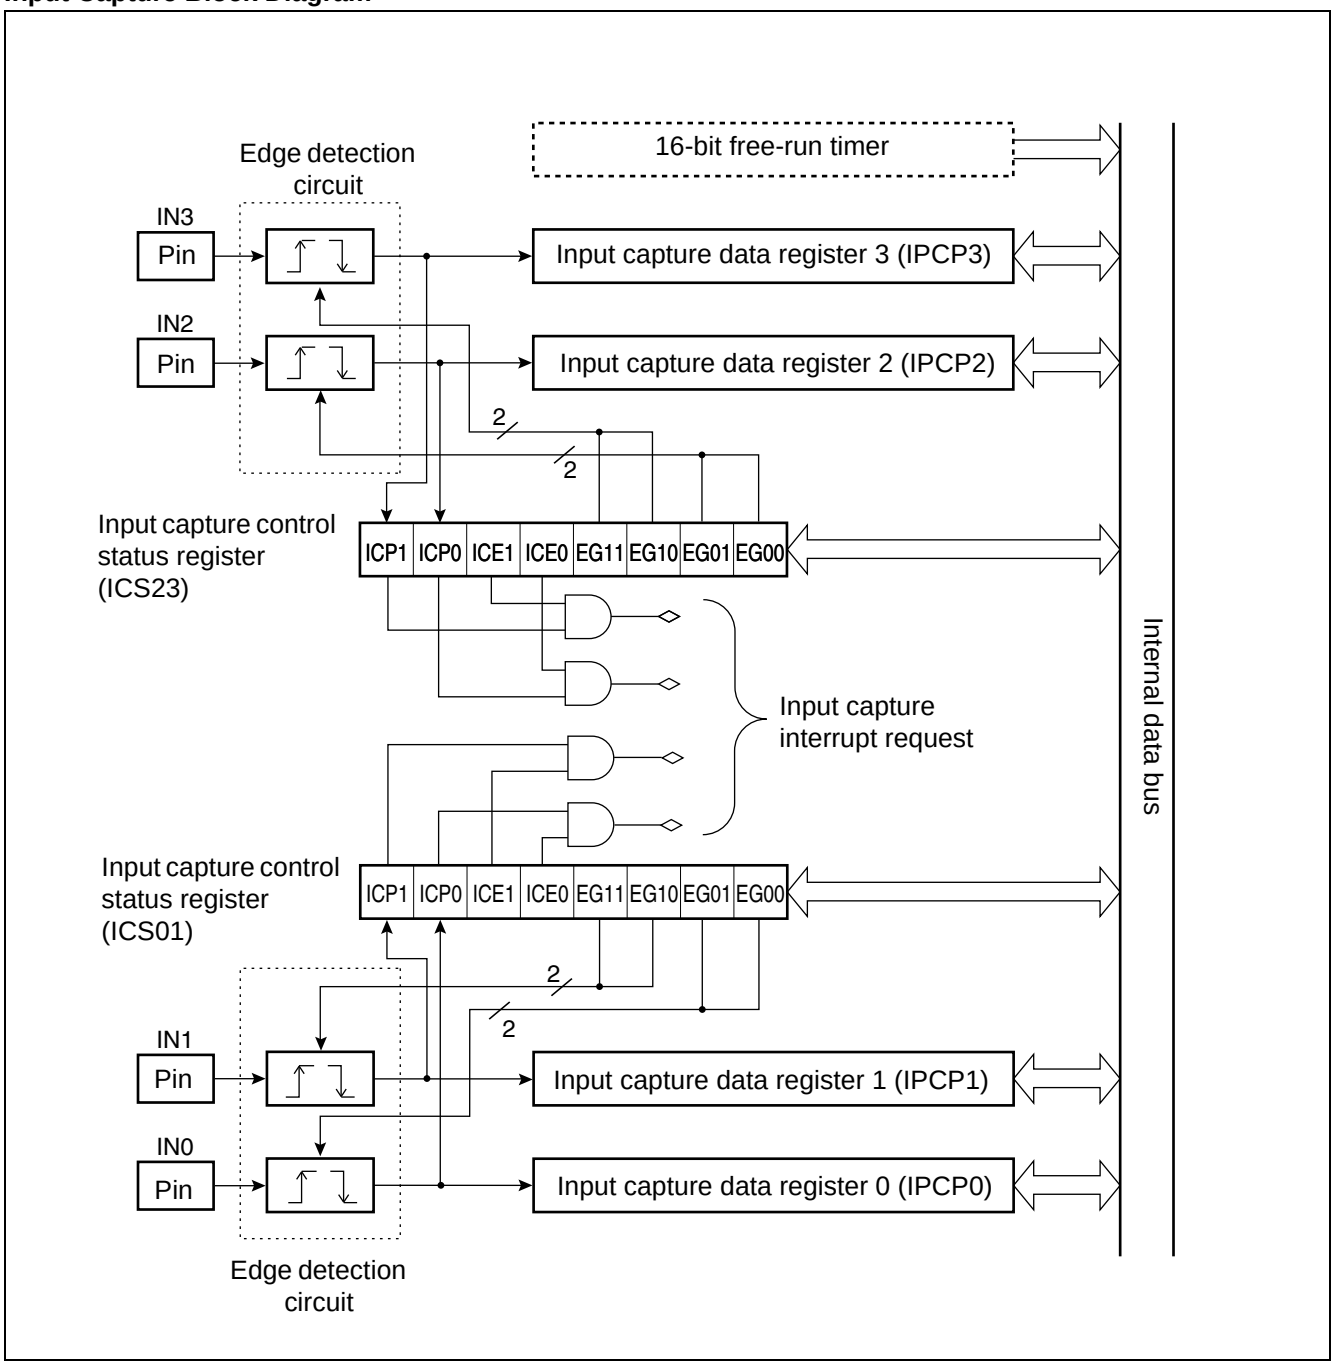
Prescaler

The prescaler divides a machine clock and provides a counter clock to the 16-bit up counter. Dividing ratio of the machine clock is specified by timer counter control status register (TCCS) among four values.

Timer Counter Data Register (TCDT)

The timer counter data register is a 16-bit up counter. A current counter value of the 16-bit free-run timer is read. Writing a value during halt of the counter allows setting an arbitrary counter value.

Input Capture Block Diagram



12.6 Watch Timer Outline

The watch timer is a 15-bit free-run counter that increments in synchronization with sub clock.

- Interval time is selectable among 7 choices, and generation of interrupt request is allowed for each interval.
- Provides operation clock to the subclock oscillation stabilizing wait timer and watchdog timer.
- Always uses subclock as a count clock regardless of settings of clock selection register (CKSCR).

Interval Timer Function

- In the watch timer, a bit corresponding to the interval time overflows (carry-over) when an interval time, which is specified by interval time selection bit, is reached. Then overflow flag bit is set (WTC: WTOF=1).
- If an interrupt by overflow is permitted (WTC: WTIE=1), an interrupt request is generated upon setting an overflow flag bit.
- Interval time of watch timer is selectable among the following seven choices:

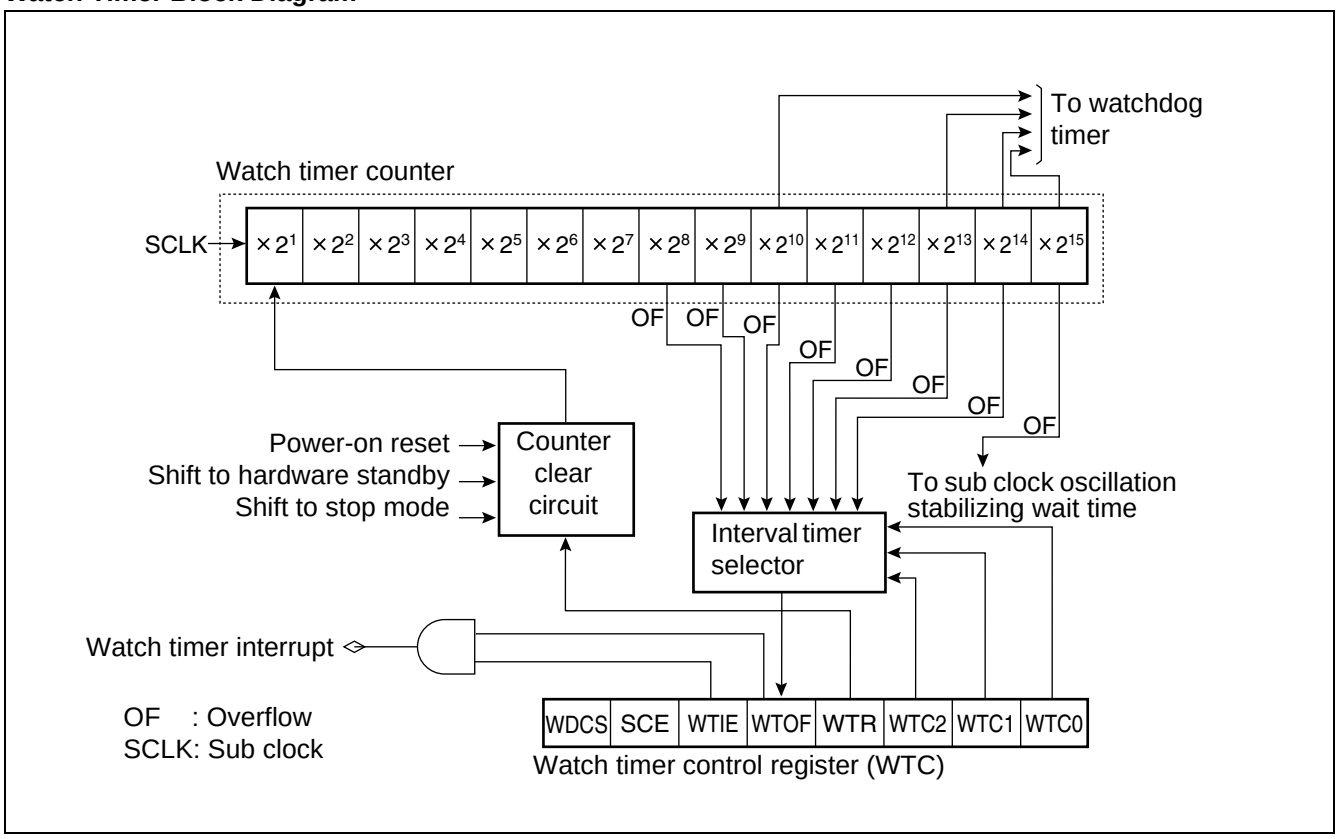
Interval Time of Watch Timer

Sub Clock Cycle	Interval Time
1/SCLK (122 μs)	2^8/SCLK (31.25 ms)
	2^9/SCLK (62.5 ms)
	2^{10}/SCLK (125 ms)
	2^{11}/SCLK (250 ms)
	2^{12}/SCLK (500 ms)
	2^{13}/SCLK (1.0 s)
	2^{14}/SCLK (2.0 s)

SCLK: Sub clock frequency

Values in parentheses “( )” are calculation when operating with 8.192 kHz clock.

Watch Timer Block Diagram



Actual interrupt request number of watch timer is as follows:
Interrupt request number: #28 ($1C_H$)

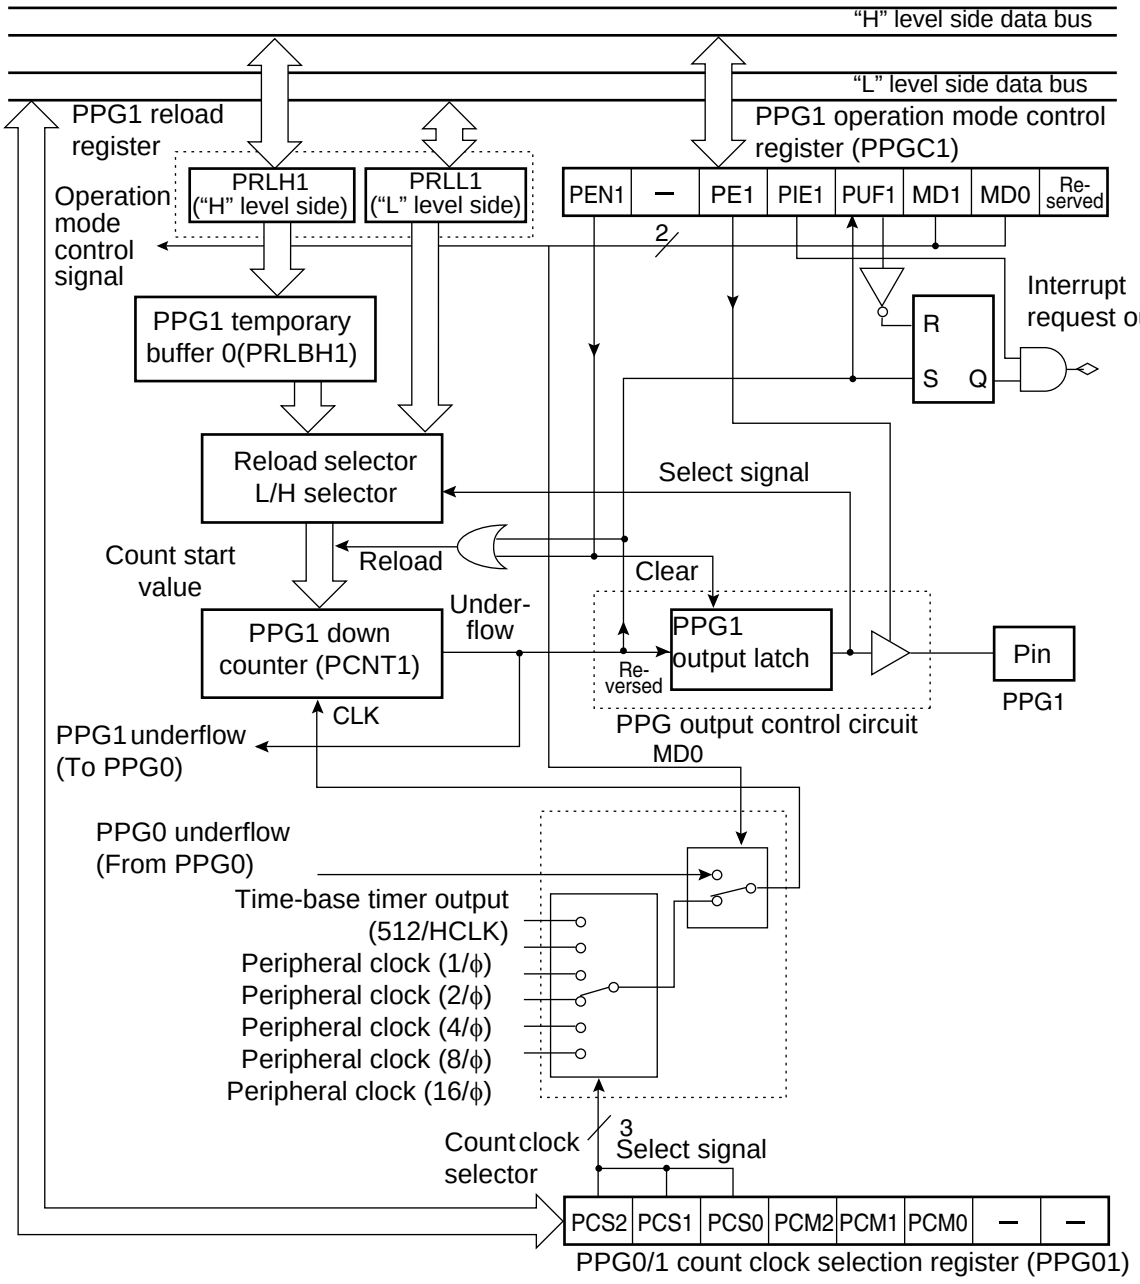
Watch Timer Counter

A 15-bit up counter that uses sub clock (SCLK) as a count clock.

Counter Clear Circuit

A circuit that clears the watch timer counter.

8/16-bit PPG Timer 1 Block Diagram



– : Undefined
Reserved: Reserved bit
HCLK : Oscillation clock frequency
ϕ : Machine clock frequency
* : Interrupt output of 8/16-bit PPG timer 1 is incorporated into one by the OR circuit against interrupt output of 8/16-bit PPG timer 0.

12.12 CAN Controller

The Controller Area Network (CAN) is a serial communication protocol compliant with CANVer2.0A and Ver2.0B. The protocol allows data transmission and reception in both standard frame format and expanded frame format.

Features of CAN Controller

- CAN controller format is compliant with CANVer2.0A and Ver2.0B.
- The protocol allows data transmission and reception in standard frame format and expanded frame format.
- Automatic transmission of data frame by remote frame reception is allowed.
- Baud rate ranges from 10 kbps to 1 Mbps (with 16-MHz machine clock).

Table 12-5. Data Transmission Baud Rate

Machine Clock	Baud Rate (Max)
16 MHz	1 Mbps
12 MHz	1 Mbps
8 MHz	1 Mbps
4 MHz	500 kbps
2 MHz	250 kbps

- Provided with 8 transmission/reception message buffers.
- Transmission/reception is allowed at ID 11 bit in standard format, and at ID 29 bit in expanded frame format.
- Specifying 0 byte to 8 bytes is allowed in message data.
- Multi-level message buffer configuration is allowed.
- CAN controller has two built-in acceptance masks. Mask settings are independently allowed for the two acceptance masks on reception IDs.
- The two acceptance masks allow reception in standard frame format and expanded frame format.
- For types of masking, all-bit comparison, all-bit masking, and partial masking with acceptance mask register 0/1, are specifiable.

Sector Configuration of 512 Kbit Flash Memory

Flash memory	CPU address	Writer address*
SA0 (32 Kbytes)	FF0000H FF7FFFH	70000H 77FFFH
SA1 (8 Kbytes)	FF8000H FF9FFFH	78000H 79FFFH
SA2 (8 Kbytes)	FFA000H FFBFFFH	7A000H 7BFFFH
SA3 (16 Kbytes)	FFC000H FFFFFFH	7C000H 7FFFFH

*: “Writer address” is an address equivalent to CPU address, which is used when data is written on Flash memory, using parallel writer. When writing/deleting data with general-purpose writer, the writer address is used for writing and deleting.

13. Electrical Characteristics

13.1 Absolute Maximum Rating

Parameter	Symbol	Rating		Unit	Remarks
		Min	Max		
Power supply voltage*1	V_{CC}	V_{SS} – 0.3	V_{SS} + 6.0	V	
	AV_{CC}	V_{SS} – 0.3	V_{SS} + 6.0	V	$V_{CC} = AV_{CC}$*2
	AVR	V_{SS} – 0.3	V_{SS} + 6.0	V	$AV_{CC} \geq AVR$*2
Input voltage*1	V_I	V_{SS} – 0.3	V_{SS} + 6.0	V	*3
Output voltage*1	V_O	V_{SS} – 0.3	V_{SS} + 6.0	V	*3
Maximum clamp current	I_{CLAMP}	– 2.0	+ 2.0	mA	*7
Total maximum clamp current	$\Sigma \mid I_{CLAMP} \mid$	–	20	mA	*7
“L” level maximum output current	I_{OL1}	–	15	mA	Normal output*4
	I_{OL2}	–	40	mA	High-current output*4
“L” level average output current	I_{OLAV1}	–	4	mA	Normal output*5
	I_{OLAV2}	–	30	mA	High-current output*5
“L” level maximum total output current	ΣI_{OL1}	–	125	mA	Normal output
	ΣI_{OL2}	–	160	mA	High-current output
“L” level average total output current	ΣI_{OLAV1}	–	40	mA	Normal output*6
	ΣI_{OLAV2}	–	40	mA	High-current output*6
“H” level maximum output current	I_{OH1}	–	–15	mA	Normal output*4
	I_{OH2}	–	–40	mA	High-current output*4
“H” level average output current	I_{OHAV1}	–	–4	mA	Normal output*5
	I_{OHAV2}	–	–30	mA	High-current output*5
“H” level maximum total output current	ΣI_{OH1}	–	–125	mA	Normal output
	ΣI_{OH2}	–	–160	mA	High-current output
“H” level average total output current	ΣI_{OHAV1}	–	–40	mA	Normal output*6
	ΣI_{OHAV2}	–	–40	mA	High-current output*6
Power consumption	P_D	–	245	mW	
Operating temperature	T_A	–40	+105	°C	
Storage temperature	Tstg	–55	+150	°C	

*1: The parameter is based on $V_{SS} = AV_{SS} = 0.0$ V.

*2: AVcc and AVR should not exceed Vcc.

*3: V_I and V_O should not exceed Vcc + 0.3 V. However if the maximum current to/from an input is limited by some means with external components, the I_{CLAMP} rating supersedes the V_I rating.

*4: A peak value of an applicable one pin is specified as a maximum output current.

*5: An average current value of an applicable one pin within 100 ms is specified as an average output current. (Average value is found by multiplying operating current by operating rate.)

*6: An average current value of all pins within 100 ms is specified as an average total output current. (Average value is found by multiplying operating current by operating rate.)

*7:

■ Applicable to pins: P10 to P17, P20 to P27, P30 to P33, P35*, P36*, P37, P40 to P44, P50 to P57
*: P35 and P36 are MB90387S and MB90F387S only.

13.4 AC Characteristics

13.4.1 Clock Timing

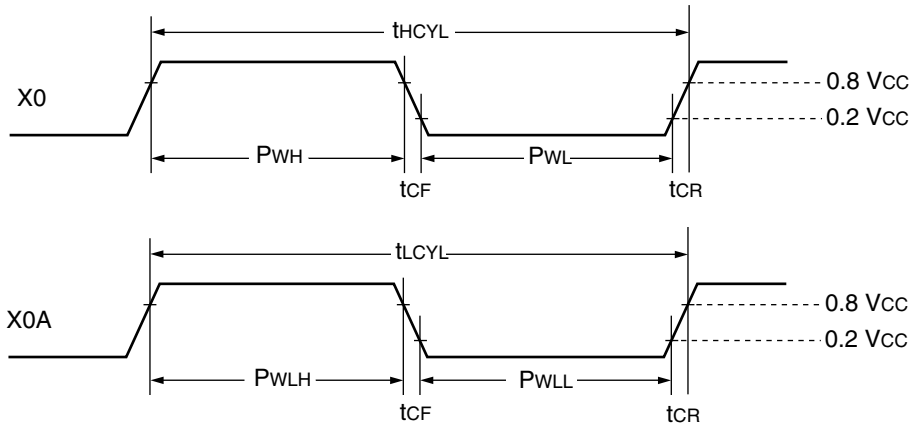
(V_{CC} = 5.0 V±10%, V_{SS} = AV_{SS} = 0.0 V, T_A = –40 °C to +105 °C)

Parameter	Symbol	Pin Name	Value			Unit	Remarks
			Min	Typ	Max		
Clock frequency	f_C	X0, X1	3	—	8	MHz	When crystal or ceramic resonator is used*2
			3	—	16	MHz	External clock input*1, *2
			4	—	16	MHz	PLL Multiply by 1 *2
			4	—	8	MHz	PLL Multiply by 2 *2
			4	—	5.33	MHz	PLL Multiply by 3 *2
			4	—	4	MHz	PLL Multiply by 4 *2
	f_{CL}	X0A, X1A	—	32.768	—	kHz	
Clock cycle time	t_{HCYL}	X0, X1	125	—	333	ns	
	t_{LCYL}	X0A, X1A	—	30.5	—	µs	
Input clock pulse width	P_{WH}, P_{WL}	X0	10	—	—	ns	Set duty factor at 30% to 70% as a guideline.
	P_{WLH},P_{WLL}	X0A	—	15.2	—	µs	
Input clock rise time and fall time	t_{CR}, t_{CF}	X0	—	—	5	ns	When external clock is used
Internal operation clock frequency	f_{CP}	—	1.5	—	16	MHz	When main clock is used
	f_{LCP}	—	—	8.192	—	kHz	When sub clock is used
Internal operation clock cycle time	t_{CP}	—	62.5	—	666	ns	When main clock is used
	t_{LCP}	—	—	122.1	—	µs	When sub clock is used

*1: Internal operation clock frequency should not exceed 16 MHz.

*2: When selecting the PLL clock, the range of clock frequency is limited. Use this product within range as mentioned in “Relation among external clock frequency and internal clock frequency”.

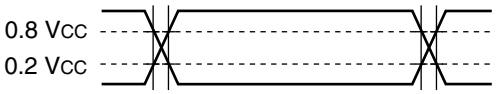
• Clock timing



Rating values of alternating current is defined by the measurement reference voltage values shown below:

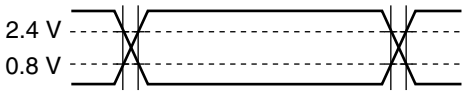
- Input signal waveform

Hysteresis input pin



- Output signal waveform

Output pin



13.4.2 Reset Input Timing

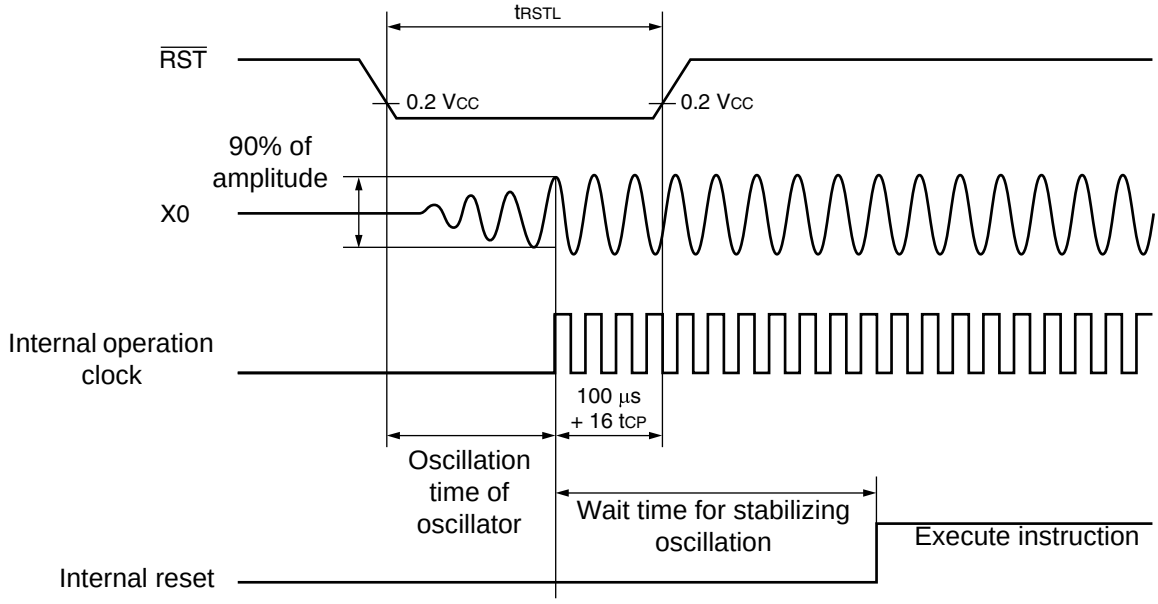
Parameter	Symbol	Pin Name	Value		Unit	Remarks
			Min	Max		
Reset input time	t_{RSTL}	RST	16 t_{CP}*3	–	ns	Normal operation
			Oscillation time of oscillator*1 + 100 μs + 16 t_{CP}*3	–	–	In sub clock*2, sub sleep*2, watch*2 and stop mode
			100	–	μs	In timebase timer

*1: Oscillation time of oscillator is time that the amplitude reached the 90%. In the crystal oscillator, the oscillation time is between several ms to tens of ms. In ceramic oscillator, the oscillation time is between hundreds of μs to several ms. In the external clock, the oscillation time is 0 ms.

*2: Except for MB90F387S and MB90387S.

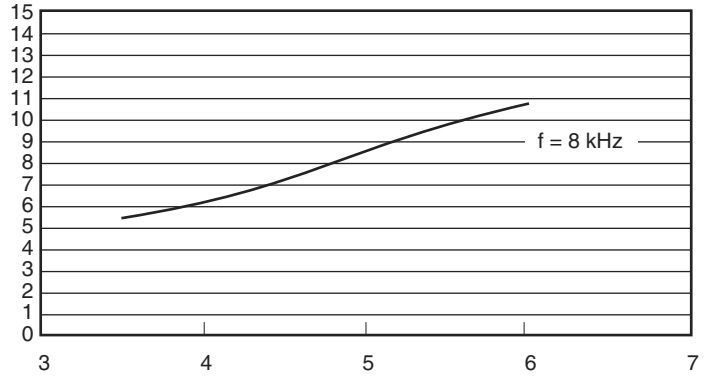
*3: Refer to "(1) Clock timing" ratings for t_{CP} (internal operation clock cycle time).

- In sub clock, sub sleep, watch and stop mode



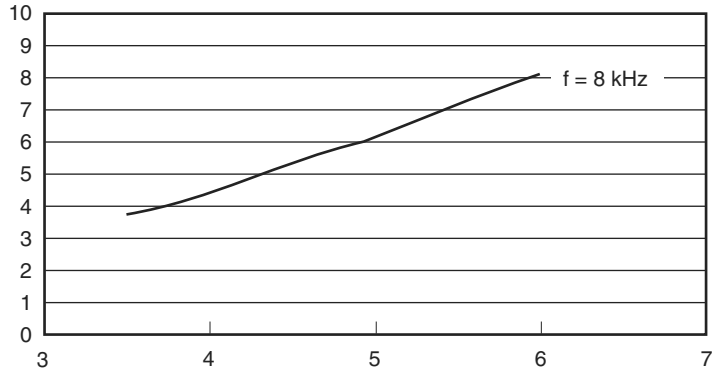
I_{CCLS} – V_{CC}

T_A = +25 °C, In external clock operation
f = Internal operating frequency



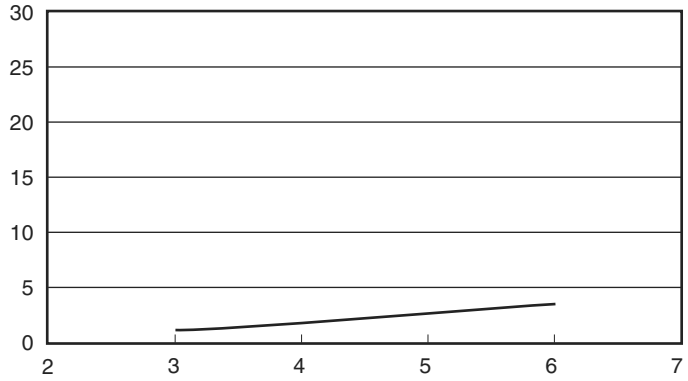
I_{CCT} – V_{CC}

T_A = +25 °C, In external clock operation
f = Internal operating frequency



I_{CCH} – V_{CC}

Stopping, T_A = +25 °C



(Continued)

17. Major Changes

Spansion Publication Number: DS07-13717-5E

Page	Section	Change Results
4	■ PRODUCT LINEUP	Changed the number of channel of 8/16 bit PPG timer. or one 16-bit channel → or two 16-bit channels
13	■ BLOCK DIAGRAM	Changed the direction of arrow of TIN0, TIN1 signals of 16-bit reload timer. right arrow (output) → left arrow (input)
67	■ ELECTRIC CHARACTERISTICS 4. AC Characteristics (4) UART timing	Changed the value of Serial clock. Serial clock “H” pulse width: $4t_{CP} \rightarrow 2t_{CP}$ Serial clock “L” pulse width: $4t_{CP} \rightarrow 2t_{CP}$

NOTE: Please see "Document History" about later revised information.
