What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Not For New Designs
Core Processor	STM8A
Core Size	8-Bit
Speed	24MHz
Connectivity	I²C, LINbus, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, POR, PWM, WDT
Number of I/O	38
Program Memory Size	32KB (32K x 8)
Program Memory Type	FLASH
EEPROM Size	1K x 8
RAM Size	2K x 8
Voltage - Supply (Vcc/Vdd)	3V ~ 5.5V
Data Converters	A/D 10x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	48-LQFP
Supplier Device Package	-

TIM1: Advanced control timer

This is a high-end timer designed for a wide range of control applications. With its complementary outputs, dead-time control and center-aligned PWM capability, the field of applications is extended to motor control, lighting and bridge driver.

- 16-bit up, down and up/down AR (auto-reload) counter with 16-bit fractional prescaler.
- Four independent CAPCOM channels configurable as input capture, output compare, PWM generation (edge and center aligned mode) and single pulse mode output
- Trigger module which allows the interaction of TIM1 with other on-chip peripherals. In the present implementation it is possible to trigger the ADC upon a timer event.
- External trigger to change the timer behavior depending on external signals
- Break input to force the timer outputs into a defined state
- Three complementary outputs with adjustable dead time
- Interrupt sources: 4 x input capture/output compare, 1 x overflow/update, 1 x break

TIM2 and TIM3: 16-bit general purpose timers

- 16-bit auto-reload up-counter
- 15-bit prescaler adjustable to fixed power of two ratios 1…32768
- Timers with three or two individually configurable CAPCOM channels
- Interrupt sources: 2 or 3 x input capture/output compare, 1 x overflow/update

5.7.5 Basic timer

The typical usage of this timer (TIM4) is the generation of a clock tick.

Table 4. TIM4

Timer	Counter width	Counter type	Prescaler factor	Channels	Inverted outputs	Repetition counter	trigger unit	External trigger	Break input
TIM4	8-bit	Up	2^n n = 0 to 7	0	None	No	No	No	No

- 8-bit auto-reload, adjustable prescaler ratio to any power of two from 1 to 128
- Clock source: master clock
- Interrupt source: 1 x overflow/update

5.8 Analog-to-digital converter (ADC)

The STM8A products described in this datasheet contain a 10-bit successive approximation ADC with up to 16 multiplexed input channels, depending on the package.

The ADC name differs between the datasheet and STM8S series and STM8AF series 8-bit microcontrollers reference manual (see *Table 5*).

Table 5. ADC naming

Peripheral name in datasheet	Peripheral name in reference manual (RM0016)
ADC	ADC1

ADC features

- 10-bit resolution
- Single and continuous conversion modes
- Programmable prescaler: f_{MASTER} divided by 2 to 18
- Conversion trigger on timer events and external events
- Interrupt generation at end of conversion
- Selectable alignment of 10-bit data in 2 x 8 bit result register
- Shadow registers for data consistency
- ADC input range: $V_{SSA} \leq V_{IN} \leq V_{DDA}$
- Analog watchdog
- Schmitt-trigger on analog inputs can be disabled to reduce power consumption
- Scan mode (single and continuous)
- Dedicated result register for each conversion channel
- Buffer mode for continuous conversion

Note: An additional AIN12 analog input is not selectable in ADC scan mode or with analog watchdog. Values converted from AIN12 are stored only into the ADC_DRH/ADC_DRL registers.

5.9 Communication interfaces

The following sections give a brief overview of the communication peripheral. Some peripheral names differ between the datasheet and STM8S series and STM8AF series 8-bit microcontrollers reference manual (see *Table 6*).

Table 6. Communication peripheral naming correspondence

Peripheral name in datasheet	Peripheral name in reference manual (RM0016)
LINUART	UART2

5.9.1 Serial peripheral interface (SPI)

The devices covered by this datasheet contain one SPI. The SPI is available on all the supported packages.

- Maximum speed: 10 Mbit/s or $f_{MASTER}/2$ both for master and slave
- Full duplex synchronous transfers
- Simplex synchronous transfers on two lines with a possible bidirectional data line
- Master or slave operation - selectable by hardware or software
- CRC calculation
- 1 byte Tx and Rx buffer
- Slave mode/master mode management by hardware or software for both master and slave
- Programmable clock polarity and phase
- Programmable data order with MSB-first or LSB-first shifting
- Dedicated transmission and reception flags with interrupt capability
- SPI bus busy status flag
- Hardware CRC feature for reliable communication:
  - CRC value can be transmitted as last byte in Tx mode
  - CRC error checking for last received byte

5.9.2 Inter integrated circuit (I^2C) interface

The devices covered by this datasheet contain one I^2C interface. The interface is available on all the supported packages.

- I^2C master features:
  - Clock generation
  - Start and stop generation
- I^2C slave features:
  - Programmable I^2C address detection
  - Stop bit detection
- Generation and detection of 7-bit/10-bit addressing and general call
- Supports different communication speeds:
  - Standard speed (up to 100 kHz),
  - Fast speed (up to 400 kHz)
- Status flags:
  - Transmitter/receiver mode flag
  - End-of-byte transmission flag
  - I^2C busy flag
- Error flags:
  - Arbitration lost condition for master mode
  - Acknowledgment failure after address/data transmission
  - Detection of misplaced start or stop condition
  - Overrun/underrun if clock stretching is disabled

10 Electrical characteristics

10.1 Parameter conditions

Unless otherwise specified, all voltages are referred to V_{SS}.

10.1.1 Minimum and maximum values

Unless otherwise specified the minimum and maximum values are guaranteed in the worst conditions of ambient temperature, supply voltage and frequencies by tests in production on 100% of the devices with an ambient temperature at T_A = -40 °C, T_A = 25 °C, and T_A = T_{Amax} (given by the selected temperature range).

Data based on characterization results, design simulation and/or technology characteristics are indicated in the table footnotes and are not tested in production.

10.1.2 Typical values

Unless otherwise specified, typical data are based on T_A = 25 °C, V_{DD} = 5.0 V. They are given only as design guidelines and are not tested.

Typical ADC accuracy values are determined by characterization of a batch of samples from a standard diffusion lot over the full temperature range.

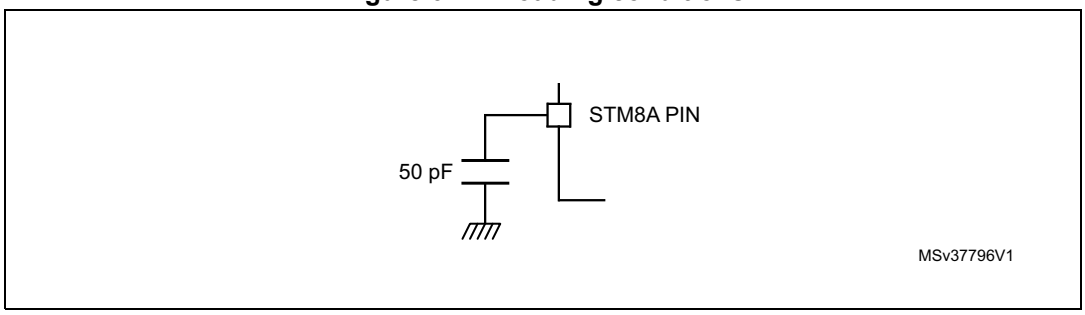
10.1.3 Typical curves

Unless otherwise specified, all typical curves are given only as design guidelines and are not tested.

10.1.4 Loading capacitor

The loading conditions used for pin parameter measurement are shown in *Figure 6*.

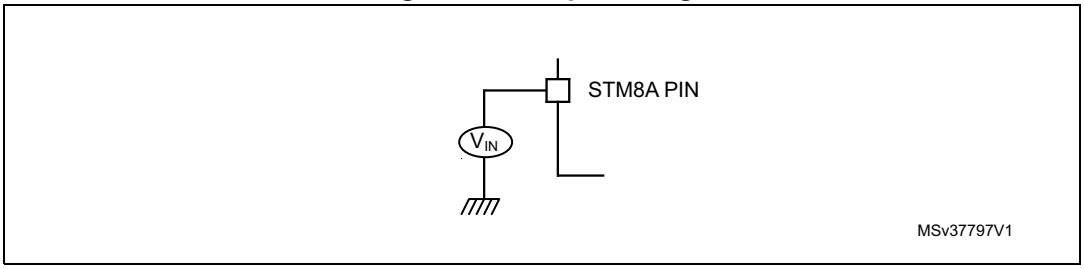
Figure 6. Pin loading conditions



10.1.5 Pin input voltage

The input voltage measurement on a pin of the device is described in *Figure 7*.

Figure 7. Pin input voltage



10.2 Absolute maximum ratings

Stresses above those listed as 'absolute maximum ratings' may cause permanent damage to the device. This is a stress rating only and functional operation of the device under these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

Table 17. Voltage characteristics

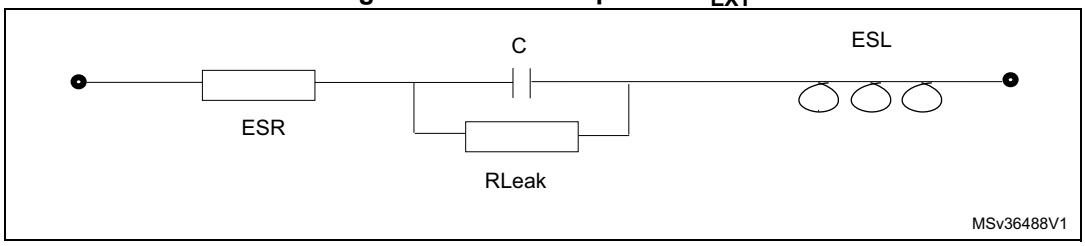
Symbol	Ratings	Min	Max	Unit
V_{DDx} - V_{SS}	Supply voltage (including V_{DDA} and V_{DDIO})(1)	-0.3	6.5	V
V_{IN}	Input voltage on true open drain pins (PE1, PE2)(2)	V_{SS} - 0.3	6.5	V
	Input voltage on any other pin(2)	V_{SS} - 0.3	V_{DD} + 0.3	
$\lvert V_{DDx} - V_{DD} \rvert$	Variations between different power pins	-	50	mV
$\lvert V_{SSx} - V_{SS} \rvert$	Variations between all the different ground pins	-	50	
V_{ESD}	Electrostatic discharge voltage	see *Absolute maximum ratings (electrical sensitivity) on page 76*		

1. All power (V_{DD}, V_{DDIO}, V_{DDA}) and ground (V_{SS}, V_{SSIO}, V_{SSA}) pins must always be connected to the external power supply
2. $I_{INJ(PIN)}$ must never be exceeded. This is implicitly insured if V_{IN} maximum is respected. If V_{IN} maximum cannot be respected, the injection current must be limited externally to the $I_{INJ(PIN)}$ value. A positive injection is induced by $V_{IN} > V_{DD}$ while a negative injection is induced by $V_{IN} < V_{SS}$. For true open-drain pads, there is no positive injection current, and the corresponding V_{IN} maximum must always be respected

10.3.1 VCAP external capacitor

Stabilization for the main regulator is achieved connecting an external capacitor C_{EXT} to the V_{CAP} pin. C_{EXT} is specified in *Table 21*. Care should be taken to limit the series inductance to less than 15 nH.

Figure 9. External capacitor C_{EXT}



1. Legend: ESR is the equivalent series resistance and ESL is the equivalent inductance.

10.3.2 Supply current characteristics

The current consumption is measured as described in *Figure 6 on page 49* and *Figure 7 on page 50*.

If not explicitly stated, general conditions of temperature and voltage apply.

Table 23. Total current consumption in Run, Wait and Slow mode. General conditions for V_{DD} apply, T_A = -40 to 150 °C

1. In CSS is used, the external clock must have a frequency above 500 kHz.

10.3.6 I/O port pin characteristics

General characteristics

Subject to general operating conditions for V_{DD} and T_A unless otherwise specified. All unused pins must be kept at a fixed voltage, using the output mode of the I/O for example or an external pull-up or pull-down resistor.

Static latch-up

Two complementary static tests are required on 10 parts to assess the latch-up performance.

- A supply overvoltage (applied to each power supply pin) and
- A current injection (applied to each input, output and configurable I/O pin) are performed on each sample.

This test conforms to the EIA/JESD 78 IC latch-up standard. For more details, refer to the application note AN1181.

Table 45. Electrical sensitivities

Symbol	Parameter	Conditions	Class(1)
LU	Static latch-up class	T_A = 25 °C	A
		T_A = 85 °C	
		T_A = 125 °C	
		T_A = 150 °C	

1. Class description: A Class is an STMicroelectronics internal specification. All its limits are higher than the JEDEC specifications, that means when a device belongs to class A it exceeds the JEDEC standard. B class strictly covers all the JEDEC criteria (international standard).
