

Welcome to **E-XFL.COM** 

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "<u>Embedded - Microcontrollers</u>"

Details	
Product Status	Active
Core Processor	AVR
Core Size	8-Bit
Speed	16MHz
Connectivity	SPI, UART/USART, USI
Peripherals	Brown-out Detect/Reset, LCD, POR, PWM, WDT
Number of I/O	54
Program Memory Size	16KB (8K x 16)
Program Memory Type	FLASH
EEPROM Size	512 x 8
RAM Size	1K x 8
Voltage - Supply (Vcc/Vdd)	2.7V ~ 5.5V
Data Converters	A/D 8x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	64-VQFN Dual Rows, Exposed Pad
Supplier Device Package	64-QFN (7x7)
Purchase URL	https://www.e-xfl.com/product-detail/atmel/atmega169p-16mch

# 1. Pin Configurations

### 1.1 Pinout - TQFP/QFN/MLF

Figure 1-1. 64A (TQFP) and 64M1 (QFN/MLF) Pinout ATmega169P

Note: The large center pad underneath the QFN/MLF packages is made of metal and internally connected to GND. It should be soldered or glued to the board to ensure good mechanical stability. If the center pad is left unconnected, the package might loosen from the board.

## 1.2 Pinout - DRQFN

Figure 1-2. 64MC (DRQFN) Pinout ATmega169P

**Table 1-1.** DRQFN-64 Pinout ATmega169P.

## 2. Overview

The ATmega169P is a low-power CMOS 8-bit microcontroller based on the AVR enhanced RISC architecture. By executing powerful instructions in a single clock cycle, the ATmega169P achieves throughputs approaching 1 MIPS per MHz allowing the system designer to optimize power consumption versus processing speed.

# 2.1 Block Diagram

Figure 2-1. Block Diagram

The AVR core combines a rich instruction set with 32 general purpose working registers. All the 32 registers are directly connected to the Arithmetic Logic Unit (ALU), allowing two independent registers to be accessed in one single instruction executed in one clock cycle. The resulting architecture is more code efficient while achieving throughputs up to ten times faster than conventional CISC microcontrollers.

The ATmega169P provides the following features: 16 Kbytes of In-System Programmable Flash with Read-While-Write capabilities, 512 bytes EEPROM, 1 Kbyte SRAM, 53 general purpose I/O lines, 32 general purpose working registers, a JTAG interface for Boundary-scan, On-chip Debugging support and programming, a complete On-chip LCD controller with internal step-up voltage, three flexible Timer/Counters with compare modes, internal and external interrupts, a serial programmable USART, Universal Serial Interface with Start Condition Detector, an 8channel, 10-bit ADC, a programmable Watchdog Timer with internal Oscillator, an SPI serial port, and five software selectable power saving modes. The Idle mode stops the CPU while allowing the SRAM, Timer/Counters, SPI port, and interrupt system to continue functioning. The Power-down mode saves the register contents but freezes the Oscillator, disabling all other chip functions until the next interrupt or hardware reset. In Power-save mode, the asynchronous timer and the LCD controller continues to run, allowing the user to maintain a timer base and operate the LCD display while the rest of the device is sleeping. The ADC Noise Reduction mode stops the CPU and all I/O modules except asynchronous timer, LCD controller and ADC, to minimize switching noise during ADC conversions. In Standby mode, the crystal/resonator Oscillator is running while the rest of the device is sleeping. This allows very fast start-up combined with low-power consumption.

The device is manufactured using Atmel's high density non-volatile memory technology. The On-chip ISP Flash allows the program memory to be reprogrammed In-System through an SPI serial interface, by a conventional non-volatile memory programmer, or by an On-chip Boot program running on the AVR core. The Boot program can use any interface to download the application program in the Application Flash memory. Software in the Boot Flash section will continue to run while the Application Flash section is updated, providing true Read-While-Write operation. By combining an 8-bit RISC CPU with In-System Self-Programmable Flash on a monolithic chip, the Atmel ATmega169P is a powerful microcontroller that provides a highly flexible and cost effective solution to many embedded control applications.

The ATmega169P AVR is supported with a full suite of program and system development tools including: C Compilers, Macro Assemblers, Program Debugger/Simulators, In-Circuit Emulators, and Evaluation kits.

### 2.2 Pin Descriptions

### 2.2.1 VCC

Digital supply voltage.

### 2.2.2 GND

Ground.

### 2.2.3 Port A (PA7:PA0)

Port A is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port A output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port A pins that are externally pulled low will source current if the pull-up resistors are activated. The Port A pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port A also serves the functions of various special features of the ATmega169P as listed on "Alternate Functions of Port A" on page 73.

### 2.2.4 Port B (PB7:PB0)

Port B is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port B output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port B pins that are externally pulled low will source current if the pull-up resistors are activated. The Port B pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port B has better driving capabilities than the other ports.

Port B also serves the functions of various special features of the ATmega169P as listed on "Alternate Functions of Port B" on page 74.

### 2.2.5 Port C (PC7:PC0)

Port C is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port C output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port C pins that are externally pulled low will source current if the pull-up resistors are activated. The Port C pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port C also serves the functions of special features of the ATmega169P as listed on "Alternate Functions of Port C" on page 77.

### 2.2.6 Port D (PD7:PD0)

Port D is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port D output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port D pins that are externally pulled low will source current if the pull-up resistors are activated. The Port D pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port D also serves the functions of various special features of the ATmega169P as listed on "Alternate Functions of Port D" on page 79.

### 2.2.7 Port E (PE7:PE0)

Port E is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port E output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port E pins that are externally pulled low will source current if the pull-up resistors are activated. The Port E pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port E also serves the functions of various special features of the ATmega169P as listed on "Alternate Functions of Port E" on page 81.

### 2.2.8 Port F (PF7:PF0)

Port F serves as the analog inputs to the A/D Converter.

Port F also serves as an 8-bit bi-directional I/O port, if the A/D Converter is not used. Port pins can provide internal pull-up resistors (selected for each bit). The Port F output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port F pins that are externally pulled low will source current if the pull-up resistors are activated. The Port F pins are tri-stated when a reset condition becomes active, even if the clock is not running. If the JTAG interface is enabled, the pull-up resistors on pins PF7(TDI), PF5(TMS), and PF4(TCK) will be activated even if a reset occurs.

Port F also serves the functions of the JTAG interface, see "Alternate Functions of Port F" on page 83.

### 2.2.9 Port G (PG5:PG0)

Port G is a 6-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port G output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port G pins that are externally pulled low will source current if the pull-up resistors are activated. The Port G pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port G also serves the functions of various special features of the ATmega169P as listed on page 85.

### 2.2.10 **RESET**

Reset input. A low level on this pin for longer than the minimum pulse length will generate a reset, even if the clock is not running. The minimum pulse length is given in Table 28-4 on page 333. Shorter pulses are not guaranteed to generate a reset.

### 2.2.11 XTAL1

Input to the inverting Oscillator amplifier and input to the internal clock operating circuit.

#### 2.2.12 XTAL2

Output from the inverting Oscillator amplifier.

#### 2.2.13 AVCC

AVCC is the supply voltage pin for Port F and the A/D Converter. It should be externally connected to  $V_{CC}$ , even if the ADC is not used. If the ADC is used, it should be connected to  $V_{CC}$  through a low-pass filter.

### 2.2.14 AREF

This is the analog reference pin for the A/D Converter.

### 2.2.15 LCDCAP

An external capacitor (typical > 470 nF) must be connected to the LCDCAP pin as shown in Figure 23-2 on page 236. This capacitor acts as a reservoir for LCD power ( $V_{LCD}$ ). A large capacitance reduces ripple on  $V_{LCD}$  but increases the time until  $V_{LCD}$  reaches its target value.

## 3. Resources

A comprehensive set of development tools, application notes and datasheets are available for download on http://www.atmel.com/avr.

# 4. Data Retention

Reliability Qualification results show that the projected data retention failure rate is much less than 1 PPM over 20 years at 85°C or 100 years at 25°C.

# 5. Register Summary

Note:

- 1. For compatibility with future devices, reserved bits should be written to zero if accessed. Reserved I/O memory addresses should never be written.
- 2. I/O Registers within the address range 0x00 0x1F are directly bit-accessible using the SBI and CBI instructions. In these registers, the value of single bits can be checked by using the SBIS and SBIC instructions.
- 3. Some of the Status Flags are cleared by writing a logical one to them. Note that, unlike most other AVRs, the CBI and SBI instructions will only operate on the specified bit, and can therefore be used on registers containing such Status Flags. The CBI and SBI instructions work with registers 0x00 to 0x1F only.
- 4. When using the I/O specific commands IN and OUT, the I/O addresses 0x00 0x3F must be used. When addressing I/O Registers as data space using LD and ST instructions, 0x20 must be added to these addresses. The ATmega169P is a complex microcontroller with more peripheral units than can be supported within the 64 location reserved in Opcode for the IN and OUT instructions. For the Extended I/O space from 0x60 0xFF in SRAM, only the ST/STS/STD and LD/LDS/LDD instructions can be used.

Mnemonics	Operands	Description	Operation	Flags	#Clocks

# **Ordering Information**

Speed (MHz) <sup>(3)</sup>	Power Supply	Ordering Code	Package <sup>(1)(2)</sup>	Operation Range
		ATmega169PV-8AU	64A	la distantial
8	1.8V - 5.5V	ATmega169PV-8MU	64M1	Industrial (-40°C to 85°C)
		ATmega169PV-8MCH	64MC	(-40 6 10 03 6)
		ATmega169P-16AU	64A	la de deial
16	2.7V - 5.5V	ATmega169P-16MU	64M1	Industrial (-40°C to 85°C)
		ATmega169P-16MCH	64MC	(-40 8 10 03 8)

- Notes: 1. This device can also be supplied in wafer form. Please contact your local Atmel sales office for detailed ordering information and minimum quantities.
  - 2. Pb-free packaging, complies to the European Directive for Restriction of Hazardous Substances (RoHS directive). Also Halide free and fully Green.
  - 3. For Speed vs.  $\rm V_{\rm CC}$  , see Figure 28-1 on page 331 and Figure 28-2 on page 332.

	Package Type
64A	64-Lead, Thin (1.0 mm) Plastic Gull Wing Quad Flat Package (TQFP)
64M1	64-pad, 9 x 9 x 1.0 mm body, lead pitch 0.50 mm, Quad Flat No-Lead/Micro Lead Frame Package (QFN/MLF)
64MC	64-lead (2-row Staggered), 7 x 7 x 1.0 mm body, 4.0 x 4.0 mm Exposed Pad, Quad Flat No-Lead Package (QFN)

# 8. Packaging Information

#### Notes:

- 1. This package conforms to JEDEC reference MS-026, Variation AEB.
- Dimensions D1 and E1 do not include mold protrusion. Allowable protrusion is 0.25 mm per side. Dimensions D1 and E1 are maximum plastic body size dimensions including mold mismatch.
- 3. Lead coplanarity is 0.10 mm maximum.

# 10. Datasheet Revision History

Please note that the referring page numbers in this section are referring to this document. The referring revision in this section are referring to the document revision.

### 10.1 Rev. 8018P 08/10

- 1. Status changed to active
- EEPROM minimum wait delay, Table 27-15 on page 312, has been changed from 9.0 ms to 3.6 ms
- 3. Datasheet layout and technical terminology updated

### 10.2 Rev. 8018O 10/09

- Changed datasheet status to "Mature"
- 2. Added Capacitance for Low-frequency Crystal Oscillator, Table 8-5 on page 33.

### 10.3 Rev. 8018N 08/09

1. Updated "Ordering Information" on page 17, MCU replaced by MCH.

### 10.4 Rev. 8018M 07/09

1. Updated the last page with new Atmel's addresses.

### 10.5 Rev. L 08/08

- 1. Updated package information in "Features" on page 1.
- 2. Added "Pinout DRQFN" on page 3:
  - The Staggered QFN is named Dual Row QFN (DRQFN).

#### 10.6 Rev. K 06/08

- 1. Updated package information in "Features" on page 1.
- 2. Removed "Disclaimer" from section "Pin Configurations" on page 2
- 3. Added "64MC (DRQFN) Pinout ATmega169P" on page 3
- 4. Added "Data Retention" on page 9.
- 5. Updated "Stack Pointer" on page 13.
- 6. Updated "Low-frequency Crystal Oscillator" on page 34.
- 7. Updated "USART Register Description" on page 194, register descriptions and tables.
- 8. Updated "UCSRnB USART Control and Status Register n B" on page 195.
- 9. Updated V<sub>IL2</sub> in "DC Characteristics" on page 329, by removing 0.2V<sub>CC</sub> from the table.

### 10.13 Rev. D 07/06

- 1. Updated "Register Description for I/O-Ports" on page 88.
- 2. Updated "Fast PWM Mode" on page 97.
- 3. Updated "Fast PWM Mode" on page 120.
- 4. Updated Table 14-2 on page 102, Table 14-4 on page 103, Table 15-3 on page 129, Table 15-4 on page 130, Table 17-2 on page 153 and Table 17-4 on page 154.
- 5 Updated "UCSRnC USART Control and Status Register n C" on page 196.
- 6. Updated Features in "USI Universal Serial Interface" on page 199.
- 7. Added "Clock speed considerations." on page 206.
- 8. Updated Features in "LCD Controller" on page 234.
- 9. Updated "Register Summary" on page 10.

### 10.14 Rev. C 06/06

- 1. Updated typos.
- 2. Updated "Calibrated Internal RC Oscillator" on page 32.
- 3. Updated "OSCCAL Oscillator Calibration Register" on page 38.
- 4. Added Table 28-2 on page 332.

### 10.15 Rev. B 04/06

1. Updated "Calibrated Internal RC Oscillator" on page 32.

### 10.16 Rev. A 03/06

1. Initial revision.
