

Welcome to [E-XFL.COM](https://www.e-xfl.com)

What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "[Embedded - Microcontrollers](#)"

Details

Product Status	Active
Core Processor	Z8
Core Size	8-Bit
Speed	12MHz
Connectivity	EBI/EMI
Peripherals	POR, WDT
Number of I/O	32
Program Memory Size	8KB (8K x 8)
Program Memory Type	OTP
EEPROM Size	-
RAM Size	236 x 8
Voltage - Supply (Vcc/Vdd)	3.5V ~ 5.5V
Data Converters	-
Oscillator Type	Internal
Operating Temperature	0°C ~ 70°C (TA)
Mounting Type	Through Hole
Package / Case	40-DIP (0.620", 15.75mm)
Supplier Device Package	-
Purchase URL	https://www.e-xfl.com/product-detail/zilog/z8674312psg

Table 1. Z86E33/733/E34, E43/743/E44 Features (Continued)

Device	ROM (KB)	RAM ¹ (Bytes)	I/O Lines	Speed (MHz)
Z86E44	16	236	32	12
¹ General-Purpose				

- Standard Temperature ($V_{CC} = 3.5 \text{ V to } 5.5 \text{ V}$)
- Extended Temperature ($V_{CC} = 3.5 \text{ V to } 5.5 \text{ V}$)
- Available Packages:
 - 28-Pin DIP/SOIC/PLCC OTP (E33/733/E34)
 - 40-Pin DIP OTP (E43/743/E44)
 - 44-Pin PLCC/LQFP OTP (E43/743/E44)
- Software Enabled Watchdog Timer (WDT)
- Push-Pull/Open-Drain Programmable on Port 0, Port 1, and Port 2
- 24/32 Input/Output Lines
- Clock-Free WDT Reset
- Auto Power-On Reset (POR)
- Programmable OTP Options:
 - RC Oscillator
 - EPROM Protect
 - Auto Latch Disable
 - Permanently Enabled WDT
 - Crystal Oscillator Feedback Resistor Disable
 - RAM Protect
- Low-Power Consumption: 60 mW
- Fast Instruction Pointer: 0.75 μs
- Two Standby Modes: STOP and HALT
- Digital Inputs CMOS Levels, Schmitt-Triggered
- Software Programmable Low EMI Mode
- Two Programmable 8-Bit Counter/Timers Each with a 6-Bit Programmable Prescaler
- Six Vectored, Priority Interrupts from Six Different Sources
- Two Comparators

- On-Chip Oscillator that Accepts a Crystal, Ceramic Resonator, LC, RC, or External Clock Drive

Functional Block Diagram

Figure 1 displays the functional block diagram.

22	V _{SS}	Ground	
23	P03	Port 0, Pin 3	Input/Output
24-28	P20-P24	Port 2, Pins 0,1,2,3,4	Input/Output

Total power dissipation should not exceed 1.21 W for the package. Power dissipation is calculated as follows:

$$\begin{aligned} \text{Total Power Dissipation} = & V_{DD} \times [I_{DD} - (\text{sum of } I_{OH})], \\ & + \text{sum of } [(V_{DD} - V_{OH}) \times I_{OH}] \\ & + \text{sum of } (V_{OL} \times I_{OL}) \end{aligned}$$

Standard Test Conditions

The characteristics listed below apply for standard test conditions as noted. All voltages are referenced to GND. Positive current flows into the referenced pin (Test Load).

Figure 13. Test Load Diagram

Capacitance

$T_A = 25\text{ }^{\circ}\text{C}$, $V_{CC} = \text{GND} = 0\text{ V}$, $f = 1.0\text{ MHz}$, unmeasured pins returned to GND.

Parameter	Min	Max
Input capacitance	0	12 pF
Output capacitance	0	12 pF
I/O capacitance	0	12 pF

Table 13. DC Electrical Characteristics $T_A = 0\text{ }^{\circ}\text{C}$ to $+70\text{ }^{\circ}\text{C}$, 12 MHz (Continued)

No.	Symbol	Parameter	V_{CC}^1	Min	Max	Units	Notes
18	TdDM(AS)	$\overline{\text{DM}}$ Valid to $\overline{\text{AS}}$ Rise Delay	3.5V	35		ns	2
			5.5V	35		ns	2
19	ThDS(AS)	$\overline{\text{DS}}$ Valid to Address Valid Hold Time	3.5V	35		ns	2
			5.5V	35		ns	2

Notes

1. The V_{CC} voltage specification of 5.5 V guarantees $5.0\text{ V} \pm 0.5\text{ V}$ and the V_{CC} voltage specification of 3.5 V guarantees only 3.5 V.
2. Timing numbers given are for minimum T_{pC} .
3. When using extended memory timing, add 2 T_{pC}

Standard Test Load

All timing references use $0.7\text{ }V_{CC}$ for a logic 1 and $0.2\text{ }V_{CC}$ for a logic 0.

For Standard Mode (not Low-EMI Mode for outputs) with SMR, D1 = 0, D0 = 0.

Table 14. DC Electrical Characteristics $T_A = -40\text{ }^{\circ}\text{C}$ to $+105\text{ }^{\circ}\text{C}$, 12 MHz

No.	Symbol	Parameter	V_{CC}^1	Min	Max	Units	Notes
1	TdA(AS)	Address Valid to $\overline{\text{AS}}$ Rise Delay	4.5V	35		ns	2
			5.5V	35		ns	2
2	TdAS(A)	$\overline{\text{AS}}$ Rise to Address Float Delay	4.5V	45		ns	2
			5.5V	45		ns	2
3	TdAS(DR)	$\overline{\text{AS}}$ Rise to Read Data Req'd Valid	4.5V		250	ns	2,3
			5.5V		250	ns	2,3
4	TwAS	$\overline{\text{AS}}$ Low Width	4.5V	55		ns	2
			5.5V	55		ns	2
5	TdAS(DS)	Address Float to $\overline{\text{DS}}$ Fall	4.5V	0		ns	
			5.5V	0		ns	
6	TwDSR	$\overline{\text{DS}}$ (Read) Low Width	4.5V	200		ns	2,3
			5.5V	200		ns	2,3
7	TwDSW	$\overline{\text{DS}}$ (Write) Low Width	4.5V	110		ns	2,3
			5.5V	110		ns	2,3
8	TdDSR(DR)	$\overline{\text{DS}}$ Fail to Read Data Req'd Valid	4.5V		150	ns	2,3
			5.5V		150	ns	2,3
9	ThDR(DS)	Read Data to $\overline{\text{DS}}$ Rise Hold Time	4.5V	0		ns	2
			5.5V	0		ns	2

			5.5V		5TpC		5TpC			6,7

Figure 18. Port 0 Configuration

Port 1 (P17-P10). Port 1 is an 8-bit, bidirectional, CMOS-compatible port with multiplexed Address (A7-A0) and Data (D7-D0) ports. These eight I/O lines can be programmed as inputs or outputs or can be configured under software control as an Address/Data port for interfacing external memory. The input buffers are Schmitt-triggered and the output buffers can be globally programmed as either push-pull or open-drain. Low EMI output buffers can be globally programmed by the software. Port 1 can be placed under handshake control. In this configuration, Port 3, lines P33 and P34 are used as the handshake controls RDY1 and $\overline{\text{DAV1}}$ (Ready and Data Available). To interface external memory, Port 1 must be programmed for the multiplexed Address/Data mode. If more than 256 external locations are required, Port 0 outputs the additional lines (see [Figure 19](#)).

In Handshake Mode, Port 3 lines P31 and P36 are used as handshake control lines. The handshake direction is determined by the configuration (input or output) assigned to bit 7 of Port 2 (see [Figure 20](#)).

Figure 20. Port 2 Configuration

Port 3 (P37-P30). Port 3 is an 8-bit, CMOS-compatible port with four fixed inputs (P33-P30) and four fixed outputs (P37-P34). These eight lines can be configured by software for interrupt and handshake control functions. Port 3, Pin 0 is Schmitt- triggered. P31, P32, and P33 are standard CMOS inputs with single trip point (no Auto Latches) and P34, P35, P36, and P37 are push-pull output lines. Low EMI output buffers can be globally programmed by the software. Two on-board comparators can process analog signals on P31

Table 19. Port 3 Pin Assignments

Pin	I/O	CTC1	Analog	Interrupt	P0 HS	P1 HS	P2 HS	Ext
P30	IN			IRQ3				
P31	IN	T _{IN}	AN1	IRQ2		D/R		
P32	IN		AN2	IRQ0	D/R			
P33	IN		REF	IRQ1		D/R		
P34	OUT		AN1-Out			R/D		DM
P35	OUT				R/D			
P36	OUT	T _{OUT}				R/D		
P37	OUT		An2-Out					

Comparator Inputs. Port 3, P31, and P32, each have a comparator front end. The comparator reference voltage P33 is common to both comparators. In analog mode, P31 and P32 are the positive input of the comparators and P33 is the reference voltage of the comparators.

Auto Latch. The Auto Latch puts valid CMOS levels on all CMOS inputs (except P33-P31) that are not externally driven. Whether this level is 0 or 1, cannot be determined. A valid CMOS level, rather than a floating node, reduces excessive supply current flow in the input buffer. Auto Latches are available on Port 0, Port 1, Port 2, and P30. There are no Auto Latches on P31, P32, and P33.

Low EMI Emission. The Z86E43/743/E44 can be programmed to operate in a low EMI Emission Mode in the PCON register. The oscillator and all I/O ports can be programmed as low EMI emission mode independently. Use of this feature results in:

- The pre-drivers slew rate reduced to 10 ns typical.
- Low EMI output drivers have resistance of 200 Ohms (typical).
- Low EMI Oscillator.
- Internal SCLK/TCLK= XTAL operation limited to a maximum of 4 MHz - 250 ns cycle time, when Low EMI Oscillator is selected.

► **Note:** *For emulation only:
Do not set the emulator to emulate Port 1 in low EMI mode. Port 1 must always be configured in Standard Mode.*

Functional Description

The MCU incorporates the following special functions to enhance the standard Z8 architecture to provide the user with increased design flexibility.

RESET. The device is reset in one of three ways:

1. Power-On Reset
2. Watchdog Timer
3. Stop Mode Recovery Source

► **Note:** *Having the Auto Power-On Reset circuitry built-in, the MCU does not need to be connected to an external power-on reset circuit. The reset time is T_{POR} . The MCU does not re-initialize WDTMR, SMR, P2M, and P3M registers to their reset values on a Stop Mode Recovery operation.*

► **Note:** *The device V_{CC} must rise up to the operating V_{CC} specification before the T_{POR} expires.*

Program Memory. The MCU can address up to 4/8/16 KB of Internal Program Memory (see [Figure 22](#)). The first 12 bytes of program memory are reserved for the interrupt vectors. These locations contain six 16-bit vectors that correspond to the six available interrupts. For EPROM mode, byte 12 (000Ch) to address 4095 (0FFFh)/8191 (1FFFh)/16384 (3FFFh), consists of programmable EPROM. After reset, the program counter points at the address 000Ch, which is the starting address of the user program.

In ROMless mode, the Z86E43/743/E44 can address up to 64 KB of External Program Memory. The ROM/ROMless option is only available on the 44-pin devices.

Figure 28. Interrupt Block Diagram

Table 20. Interrupt Types, Sources, and Vectors

Name	Source	Vector Location	Comments
IRQ0	$\overline{\text{DAV0}}$, IRQ0	0,1	External (P32), Rising/Falling Edge Triggered
IRQ1	IRQ1	2,3	External (P33), Falling Edge Triggered
IRQ2	$\overline{\text{DAV2}}$, IRQ2, T_{IN}	4,5	External (P31), Rising/Falling Edge Triggered
IRQ3	IRQ3	6,7	External (P30), Falling Edge Triggered
IRQ4	T0	8,9	Internal
IRQ5	T1	10,11	Internal

Figure 31. Stop Mode Recovery Register (Write-Only Except Bit D7, Which Is Read-Only)

SCLK/TCLK Divide-by-16 Select (D0). This bit of the SMR controls a divide-by-16 prescaler of SCLK/TCLK. The purpose of this control is to selectively reduce device power consumption during normal processor execution (SCLK control) and/or HALT mode (where TCLK sources counter/timers and interrupt logic).

External Clock Divide-by-Two (D1). This bit can eliminate the oscillator divide-by-two circuitry. When this bit is 0, the System Clock (SCLK) and Timer Clock (TCLK) are equal to the external clock frequency divided by two. The SCLK/TCLK is equal to the external clock frequency when this bit is set (D1=1). Using this bit together with D7 of PCON further helps lower EMI (that is, D7 (PCON) = 0, D1 (SMR) = 1). The default setting is zero.

Stop Mode Recovery Source (D2, D3, and D4). These three bits of the SMR register specify the wake up source of the Stop Mode Recovery (Figure 32). Table 22 shows the SMR source selected with the setting of D2 to D4. P33-P31 cannot be used to wake up
